UNITED STATES
SECURITIES AND EXCHANGE COMMISSION
Washington, D.C. 20549

FORM 8-K

CURRENT REPORT

Pursuant to Section 13 or 15(d) of the Securities Exchange Act of 1934

Date of report (date of earliest event reported): April 13, 2018

TONIX PHARMACEUTICALS HOLDING CORP.
(Exact name of registrant as specified in its charter)

Nevada	**001-36019**	**26-1434750**
(State or Other Jurisdiction of Incorporation)	**(Commission File Number)**	**(IRS Employer Identification No.)**

509 Madison Avenue, Suite 306, New York, New York 10022
(Address of principal executive offices) (Zip Code)

Registrant's telephone number, including area code: (212) 980-9155

Copy of correspondence to:

Michael J. Lerner, Esq.
Lowenstein Sandler LLP
One Lowenstein Drive
Roseland, NJ 07068
Tel: (973) 597-2500 Fax: (973) 597-6395

Check the appropriate box below if the Form 8-K filing is intended to simultaneously satisfy the filing obligation of the registrant under any of the following provisions (see General Instruction A.2. below):

☐ Written communications pursuant to Rule 425 under the Securities Act (17 CFR 230.425)
☐ Soliciting material pursuant to Rule 14a-12 under the Exchange Act (17 CFR 240.14a-12)
☐ Pre-commencement communications pursuant to Rule 14d-2(b) under the Exchange Act (17 CFR 240.14d-2(b))
☐ Pre-commencement communications pursuant to Rule 13e-4(c) under the Exchange Act (17 CFR 240.13e-4(c))

Indicate by check mark whether the registrant is an emerging growth company as defined in Rule 405 of the Securities Act of 1933 (§ 230.405 of this chapter) or Rule 12b-2 of the Securities Exchange Act of 1934 (§ 240.12b-2 of this chapter).
Emerging growth company ☐

If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act. ☐

Item 7.01 Regulation FD Disclosure.

Tonix Pharmaceuticals Holding Corp. (the "Company") updated its investor presentations, which are used to conduct meetings with investors, stockholders and analysts and at investor conferences, and which the Company intends to place on its website, which may contain nonpublic information. Copies of the presentations are filed as Exhibit 99.01, 99.02 and 99.03 hereto and incorporated herein by reference.

Item 9.01 Financial Statements and Exhibits.

(d) Exhibits.

99.01	Corporate Presentation by the Company for April 2018 (Long Form)*
99.02	Corporate Presentation by the Company for April 2018 (Short Form)*
99.03	Corporate Presentation by the Company for April 2018 (Abbreviated Form)*

_____

* Furnished herewith.

SIGNATURE

Pursuant to the requirement of the Securities Exchange Act of 1934, the registrant has duly caused this report to be signed on its behalf by the undersigned thereunto duly authorized.

Investor Presentation

TONIX PHARMACEUTICALS

April 2018

Version P0109 4-13-18 (Doc 0339)

Cautionary Note on Forward-Looking Statements

Certain statements in this presentation regarding strategic plans, expectations and objectives for future operations or results are "forward-looking statements" as defined by the Private Securities Litigation Reform Act of 1995. These statements may be identified by the use of forward-looking words such as "anticipate," "believe," "forecast," "estimate" and "intend," among others. These forward-looking statements are based on Tonix's current expectations and actual results could differ materially. There are a number of factors that could cause actual events to differ materially from those indicated by such forward-looking statements. These factors include, but are not limited to, substantial competition; our need for additional financing; uncertainties of patent protection and litigation; uncertainties of government or third party payor reimbursement; limited research and development efforts and dependence upon third parties; and risks related to failure to obtain U.S. Food and Drug Administration clearances or approvals and noncompliance with its regulations. As with any pharmaceutical under development, there are significant risks in the development, regulatory approval and commercialization of new products. The forward-looking statements in this presentation are made as of the date of this presentation, even if subsequently made available by Tonix on its website or otherwise. Tonix does not undertake an obligation to update or revise any forward-looking statement, except as required by law. Investors should read the risk factors set forth in the Annual Report on Form 10-K for the year ended December 31, 2017, as filed with the Securities and Exchange Commission (the "SEC") on March 9, 2018, and periodic reports filed with the SEC on or after the date thereof. All of Tonix's forward-looking statements are expressly qualified by all such risk factors and other cautionary statements.

Tonix Development Highlights

Cyclobenzaprine Sublingual Tablets

Lead Program Tonmya®[1] - FDA Breakthrough Therapy in PTSD[2]
- Phase 3 HONOR study enrolling- bedtime treatment for PTSD

TNX-102 SL[3] - Bedtime treatment for agitation in Alzheimer's disease
- Phase 2 IND submitted in March 2018

Pipeline

TNX-601[4] - Pre-IND candidate for daytime treatment for PTSD
- Nonclinical development ongoing

TNX-801[5] - Smallpox-preventing vaccine candidate
- Efficacy demonstrated in mice model
- cGMP process development underway

[1] Tonmya has been conditionally accepted by the U.S. FDA as the proposed trade name for TNX-102 SL (cyclobenzaprine HCl sublingual tablets) for PTSD. Tonmya is an investigational new drug and has not been approved for any indication.
[2] PTSD = Posttraumatic stress disorder
[3] TNX-102 SL is an investigational new drug and has not been approved for any indication.
[4] Tianeptine oxalate
[5] Synthesized live horsepox virus

Tonix focuses on discovering and developing pharmaceutical products to treat serious neuropsychiatric conditions and to improve biodefense through developing potential medical counter-measures

Tonmya®[1] (cyclobenzaprine HCl sublingual tablets) = bedtime treatment for posttraumatic stress disorder (PTSD)

- Phase 3 HONOR study in military-related PTSD enrolling
- Breakthrough Therapy designation granted by the U.S. Food and Drug Administration (FDA)

TNX-102 SL (cyclobenzaprine HCl sublingual tablets) = bedtime treatment for Agitation in Alzheimer's (AAD)

- Pre-IND meeting held Nov 2017
- IND (Investigational New Drug) application submitted 1Q2018

TNX-601 (tianeptine oxalate) = daytime treatment for PTSD

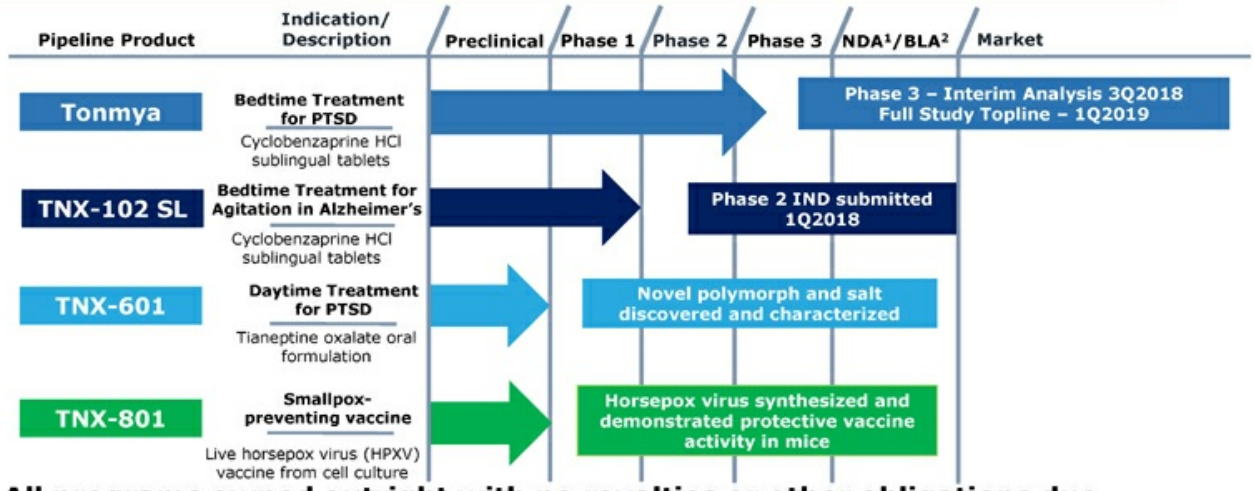
- Ongoing preclinical development
- Novel salt and polymorph of an active ingredient marketed in Europe for depression with efficacy evidence in PTSD from published literature

TNX-801 (synthesized live horsepox virus) = vaccine to potentially prevent smallpox

- New England Journal of Medicine letter[2] found a 1902 U.S. smallpox vaccine to have a genomic core 99.7% similar to horsepox
- Eligible for an FDA Priority Review Voucher (PRV) under the 21st Century Cures Act[3]

[1] Tonmya has been conditionally accepted by the U.S. FDA as the proposed trade name for TNX-102 SL (cyclobenzaprine HCl sublingual tablets) for PTSD. TNX-102 SL is an investigational new drug and has not been approved for any indication.
[2] Schrick, L. et al. , N Engl J Med 2017; 377:1491-1492, http://www.nejm.org/doi/full/10.1056/NEJMc1707600.
[3] PRV's issued upon licensure if accepted as medical counter-measure.

Candidates in Development



All programs owned outright with no royalties or other obligations due

[1]NDA- New Drug Application; [2]BLA –Biologic Licensing Application; [3]Investigational New Drug Application

Tonmya (Cyclobenzaprine HCl Sublingual Tablets) for PTSD

Phase 3 HONOR study in military-related PTSD enrolling

- Encouraging evidence of safety and efficacy was demonstrated in Phase 2
- CAPS-5[1] ≥ 33 is entry criteria in Phase 3, CAPS-5 ≥ 29 was used in Phase 2

Breakthrough Therapy designation from the FDA

- Expedited development and accelerated review are expected
- Potential to file NDA[1] based on one Phase 3 study if data are statistically persuasive

Proposed registration plan agreed to by the FDA

- Additional nonclinical safety and clinical abuse potential studies are not required

Patent protection through 2034 in U.S.[2]

- Composition of matter patent for eutectic, required for transmucosal delivery of cyclobenzaprine

Novel mechanism targets sleep quality

- Memory processing during sleep is important to recovery

[1] CAPS-5 = Clinician-Administered PTSD Scale for DSM-5; accepted primary endpoint for regulatory approval
[2] U.S. Patent No. 9,636,408 for eutectic proprietary Protectic™ formulation

Phase 3 HONOR Study Enrolling:
To confirm Phase 2 AtEase findings in military-related PTSD

General study characteristics:

Randomized, double-blind, placebo-controlled.
~550 participants in approximately 40 U.S. sites.

Tonmya once-daily at bedtime
5.6 mg *N ~ 275 (~140**)*

Placebo once-daily at bedtime
*N ~ 275 (~140**)*

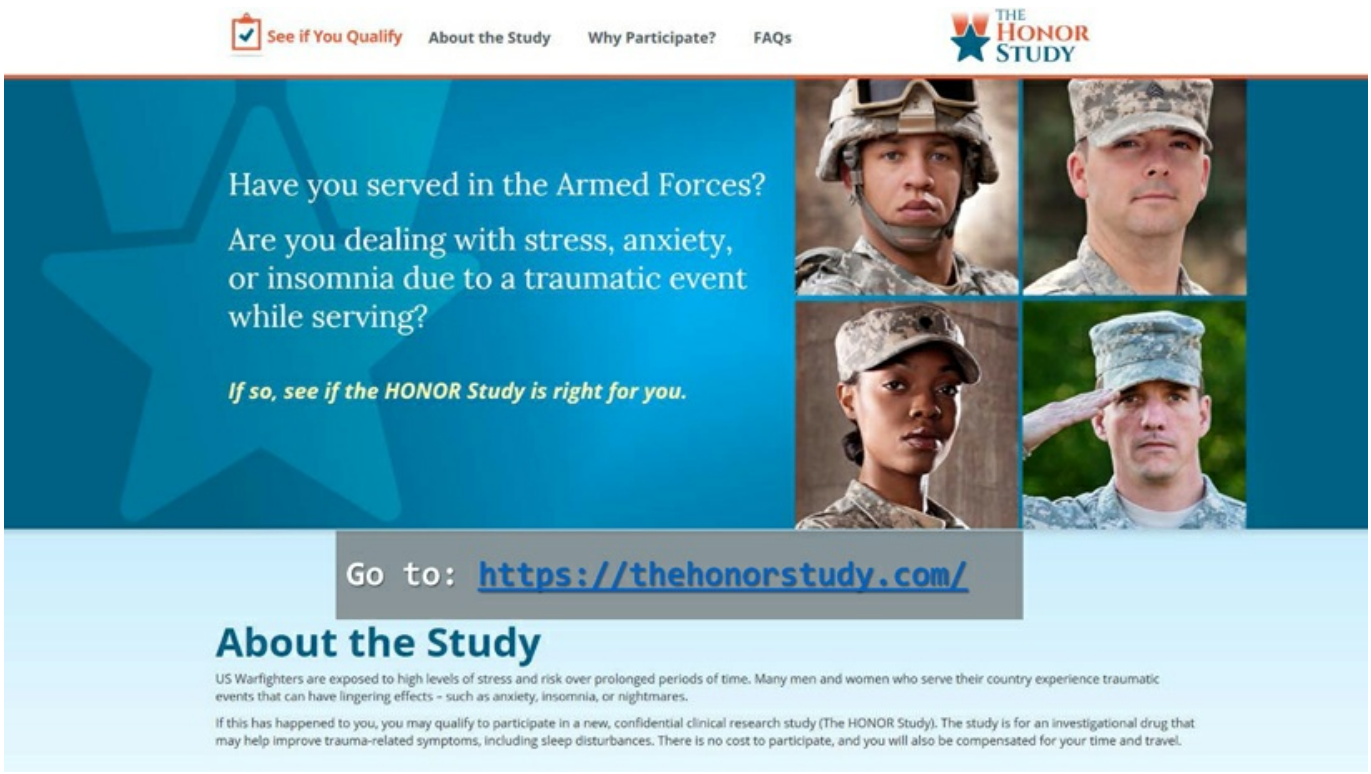
12 weeks → ····· *open-label extension*

Primary endpoint CAPS-5[1]:

- Mean change from baseline at week 12 (Tonmya 5.6 mg vs. placebo)
- Unblinded interim analysis will be reviewed by IDMC[2] to determine: (i) Early stop for efficacy (requires p-value < 0.01[3]), (ii) continuation as planned or (iii) sample size adjustment.
- Success for study with ~550 participants requires p-value < 0.045[3]

3Q 2018 – Interim Analysis outcome anticipated
1Q 2019 – topline data anticipated, if 550 participants are studied

[1]CAPS-5 = Clinician-Administered PTSD Scale for DSM-5
[2]IDMC=Independent data monitoring committee
[3]Pending final agreement with FDA on interim and complete Statistical Analysis Plans



See if You Qualify
About the Study
Why Participate?
FAQs
THE HONOR STUDY
Have you served in the Armed Forces?
Are you dealing with stress, anxiety, or insomnia due to a traumatic event while serving?
If so, see if the HONOR Study is right for you.
Go to: https://thehonorstudy.com/
About the Study
US Warfighters are exposed to high levels of stress and risk over prolonged periods of time. Many men and women who serve their country experience traumatic events that can have lingering effects – such as anxiety, insomnia, or nightmares.
If this has happened to you, you may qualify to participate in a new, confidential clinical research study (The HONOR Study). The study is for an investigational drug that may help improve trauma-related symptoms, including sleep disturbances. There is no cost to participate, and you will also be compensated for your time and travel.

Breakthrough Therapy Designation

FDA granted Tonmya Breakthrough Therapy designation – reported December 19, 2016

- PTSD is a serious condition
- Tonmya has potential advantages over existing therapies in military-related PTSD

Benefits of Breakthrough Therapy designation

- Eligibility for priority review of the NDA within 6 months instead of 10-12 months
- Option to submit completed portions of the NDA for rolling review
- An organizational commitment involving FDA's senior managers to accelerate the development and approval process, an opportunity to compress development time

NDA filing based on HONOR study is possible if results are statistically persuasive

- Discussed at March 9, 2017 Initial Cross-disciplinary Breakthrough Meeting with the FDA

No Recognized Abuse Potential in Clinical Studies

Active ingredient is cyclobenzaprine, which is structurally related to tricyclic antidepressants

- Cyclobenzaprine interacts with receptors that regulate sleep quality: 5-HT_{2A}; α_1-adrenergic and histamine H_1 receptors
- Cyclobenzaprine does **NOT** interact with the same receptors as traditional hypnotic sleep drugs, benzodiazepines or non-benzodiazepines that are associated with retrograde amnesia
- Cyclobenzaprine-containing product was approved 40 years ago and current labeling (May 2016) indicates no abuse or dependence concern

Tonmya NDA can be filed without drug abuse and dependency assessment studies

- Discussed at March 9, 2017 Initial Cross-disciplinary Breakthrough Meeting with the FDA

TNX-102 SL Intellectual Property – U.S. Protection until 2034

Composition of matter (eutectic)

- U.S. Patent No. 9,636,408 issued in May 2017 by U.S. Patent and Trademark Office (USPTO)
  - Protection expected to 2034
- Japan Patent Office (JPO) issued Notice of Allowance in March 2018 for Patent Application 2016-503239
- Additional claims and jurisdictions pending

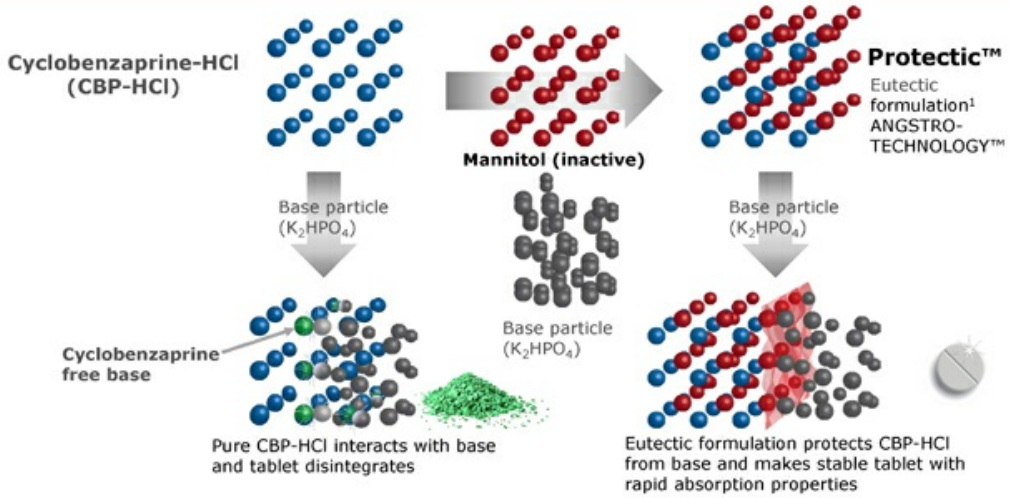
Pharmacokinetics (PK)

- JPO issued Japanese Patent No. 6259452 in December 2017
  - Protection expected to 2033
- Additional claims and jurisdictions pending

Method of use for active ingredient cyclobenzaprine

- European Patent Office issued European Patent No. 2,501,234 in September 2017
  - Protection expected to 2030
- USPTO issued Notice of Allowance in January 2018 for U.S. Patent Application 12/948,828
  - Expect patent to issue soon; protection expected to 2030
- Additional claims and jurisdictions pending

Proprietary Cyclobenzaprine Hydrochloride Eutectic Mixture Stabilizes Sublingual Tablet Formulation



[1] U.S. Patent issued May 2, 2017

TNX-102 SL: Sublingual Formulation is Designed for Bedtime Administration

TNX-102 SL: Proprietary sublingual formulation of cyclobenzaprine (CBP) with transmucosal absorption

- Innovation by design with patent protected CBP/mannitol eutectic
- Rapid systemic exposure
- Increases bioavailability during sleep
- Avoids first-pass metabolism
- Lowers exposure to long-lived active major metabolite, norcyclobenzaprine (norCBP)

CBP undergoes extensive first-pass hepatic metabolism when orally ingested

- Active major metabolite, norCBP[1]
  - Long half-life (~72 hours)
  - Less selective for target receptors (5-HT_{2A}, α_1-adrenergic, histamine H_1)
  - More selective for norepinephrine transporter

[1] Daugherty et al., Abstract 728, Society of Biological Psychiatry 70th Annual Scientific Convention, May 14-16, 2015, Toronto Ontario, Canada

Tonmya: Novel Mechanism Targets Sleep Quality for Recovery from PTSD

PTSD is a disorder of recovery

- Most people exposed to extreme trauma recover over a few weeks
- In PTSD, recovery process impeded due to insufficient sleep-dependent memory processing

Memory processing is essential to recovery

- Vulnerability to memory intrusions and trauma triggers remains if no consolidation of new learning (extinction)

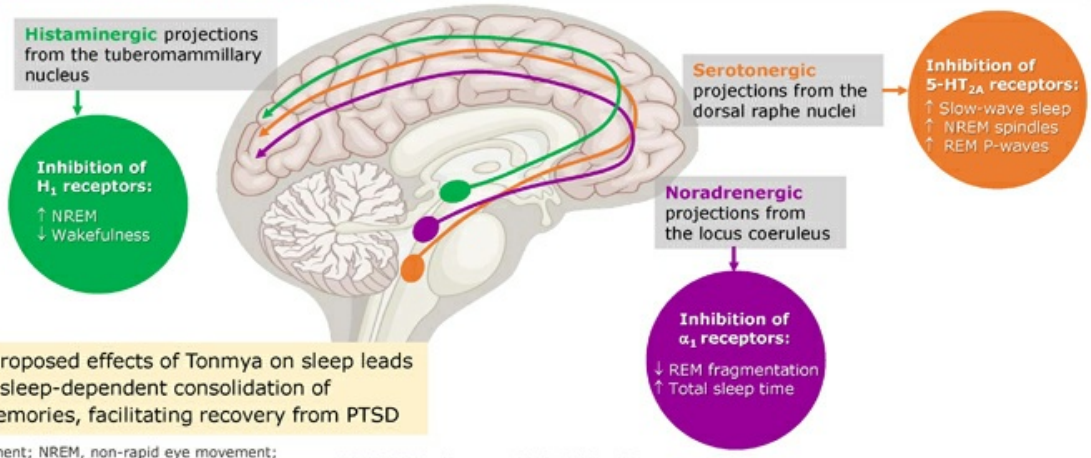
Tonmya targets sleep quality[1]

- The active ingredient in Tonmya, cyclobenzaprine, interacts with receptors that regulate sleep quality: strongly binds and potently blocks 5-HT_{2A}, α_1-adrenergic and histamine H_1 receptors, permissive to sleep-dependent recovery processes

[1] Daugherty et al., Abstract 728, Society of Biological Psychiatry 70th Annual Scientific Convention, May 14-16, 2015, Toronto Ontario, Canada

Proposed Mechanism of Action of Tonmya in the Treatment of PTSD:
The Effects of Nocturnal Neuroreceptor Blockade on Sleep

Cyclobenzaprine is a functional antagonist at serotonergic 5-HT_{2A} receptors, noradrenergic α_1 receptors, and histaminergic H_1 receptors



The overall proposed effects of Tonmya on sleep leads to increased sleep-dependent consolidation of extinction memories, facilitating recovery from PTSD

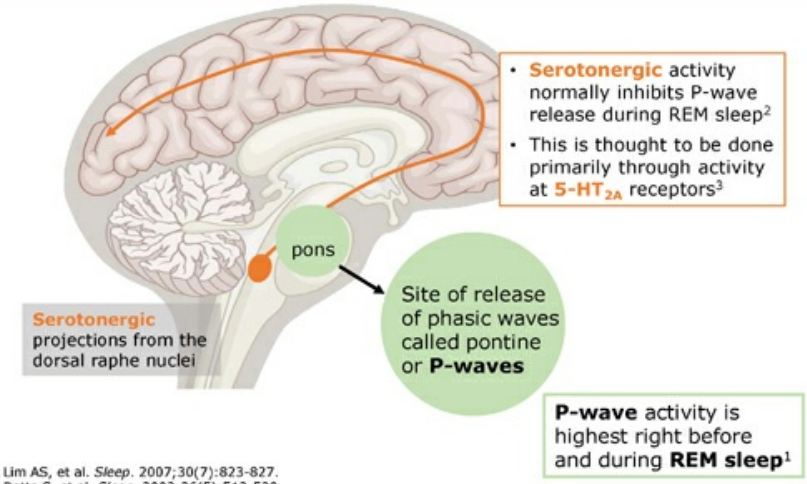
REM, rapid eye movement; NREM, non-rapid eye movement; P-waves, ponto-geniculo-occipital waves

Proposed Mechanism of Action of Tonmya in the Treatment of PTSD:
Focus on Nocturnal 5-HT_{2A} Receptor Blockade in REM

- Generally, serotonin (5-HT) activity promotes the awake state and inhibits REM sleep; whereas once in REM sleep, the 5-HT system is normally quiescent
- Extinction learning is critical to recovery from trauma, and such new learning is consolidated (moving from labile short term to established long term memory) during particular stages of sleep[1,2]
- Recent rodent research shows how particular brain wave patterns during REM sleep, known as "P-waves" are critical to extinction consolidation[3]
- 5-HT activation of pontine brainstem region richly expressing 5-HT_{2A} receptors inhibits P-wave generation during REM[4]
- Nocturnal blockage of 5-HT_{2A} receptors may restore extinction consolidation by inhibition of errant 5-HT stimulation during REM (see model in next 2 slides)

1. Pace-Schott, et al. *Biology of Mood & Anxiety Disorders*. 2015;5(3):1-19.
2. Straus et al. Biol Psych: CNNI. 2017;2(2):123-129.
3. Datta S, et al. *J Neurosci*. 2013;33(10):4561-4569.
4. Datta S, et al. *Sleep*. 2003;26(5):513-520.

Fear Extinction Memory Consolidation: The Proposed Role of P-Waves, REM Sleep, and Serotonergic Neuroreceptor Activity



- Increased P-wave activity during REM sleep is critical for fear extinction memory consolidation in rats[4]
- By blocking 5-HT_{2A} receptors, cyclobenzaprine may sustain P-wave activity during REM sleep
- This blockade may lead to better quality of REM sleep with increased fear extinction consolidation in individuals with PTSD, facilitating recovery

P-waves, ponto-geniculo-occipital waves; REM, rapid eye movement

4. Datta S, et al. *J Neurosci*. 2013;33(10):4561-4569.

What are the Consequences of PTSD?

Consequences:

- Impaired daily function and substantial interference with work and social interactions
- Reckless or destructive behavior
- Increased health care utilization and greater medical morbidity

PTSD as a risk factor for:

- Depression
- Alcohol or substance abuse
- Absenteeism/unemployment
- Homelessness
- Violent acts
- Suicidal thoughts and suicide

What are the Symptoms of PTSD?

Symptoms of PTSD fall into four clusters:

1. Intrusion (aversive memories, nightmares, flashbacks)
2. Avoidance (avoiding persons, places or situations)
3. Mood/cognitions (memory block, emotional numbing, detachment from others)
4. Hyperarousal (anxiety, agitation & sleep disturbance)

CAPS-5 is used to assess symptom severity and treatment effect

- Recognized as the standard for rating PTSD severity in clinical trials
- Takes into account all four symptom clusters
- Global regulatory approval standard (approval of sertraline and paroxetine were based on CAPS score)

What are the Consequences of PTSD?

Consequences:

- Impaired daily function and substantial interference with work and social interactions
- Reckless or destructive behavior
- Increased health care utilization and greater medical morbidity

PTSD as a risk factor for:

- Depression
- Alcohol or substance abuse
- Absenteeism/unemployment
- Homelessness
- Violent acts
- Suicidal thoughts and suicide

PTSD: U.S. Prevalence and Index Traumas

A chronic response to traumatic event(s)

- A majority of people will experience a traumatic event at some point in their lifetime[1]
  - 20% of women and 8% of men in the U.S. who experience significant trauma develop PTSD[1]
  - *Lifetime prevalence:* 6.8%[2] (~ 17.0 million adults in the U.S.)
    - Persistent - >1/3 fail to recover, even after several years following the trauma[2]
  - *Twelve month prevalence:* *U.S.* 3.5% (~ 8.6 million adults) [3]
    EU 2.3% (~10.0 million adults) [4]

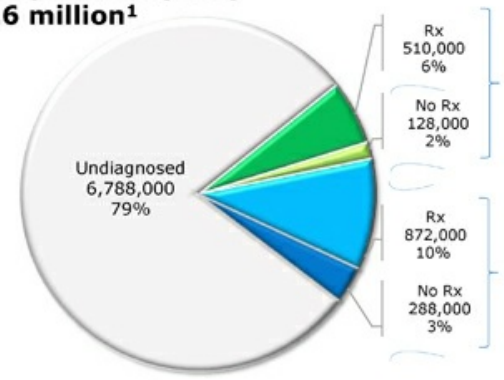
Most common forms of trauma[1]

- Witnessing someone being badly injured or killed
- Natural disaster
- Life-threatening accident
- Sexual or physical assault

[1] Kessler et al., Arch Gen Psychiatry 1995; 52:1048
[2] Kessler et al., Arch Gen Psychiatry 2005; 62:593
[3] Kessler et al., Arch Gen Psychiatry 2005; 62:617; Prevalence rate of 3.5% applied to U.S. Census estimate of 247 million U.S. adult (≥18) population in 2015 (www.census.gov/quickfacts/table/PST045215/00)
[4] The European Union Market Potential for a New PTSD Drug. Prepared for Tonix Pharmaceuticals by Procela Consultants Ltd, September 2016

PTSD Prevalence and Market Characteristics

Prevalent Population (U.S.)
~8.6 million[1]



Diagnosed population

Large population (~1.8 million)
Majority receive drug treatment
- Civilians: ~75%[2]
- Veterans: ~80%[4]

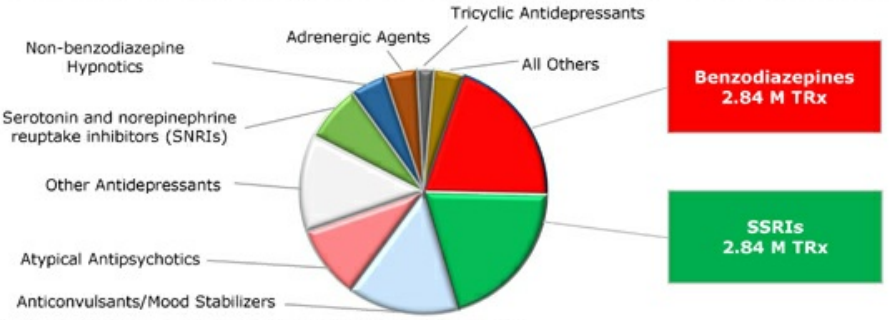
[1] Kessler, et al., 2005; Prevalence rate of 3.5% applied to U.S. Census estimate of 247 million U.S. adult (≥18) population in 2015 (www.census.gov/quickfacts/table/PST045215/00)
[2] IMS Consulting, *Market Sizing & Treatment Dynamics: Post-Traumatic Stress Disorder (PTSD) Patients*, 2016*
[3] Bowe and Rosenheck, 2015 (638,451 veterans diagnosed with PTSD in the VA in fiscal year 2012 across all medical centers)
[4] Bernardy et al., 2012 (80% of veterans diagnosed with PTSD had at least one medication from the Clinical Practice Guidelines)

What Drug Classes are Used to Treat PTSD?

Market highly fragmented, with benzodiazepines widely prescribed (but not indicated)[1]

- Multiple medications per patient (or "Polypharmacy") is the norm
  - Approximately 55% of patients receive a benzodiazepine, and 53% receive a selective serotonin reuptake inhibitor (SSRI)
- SSRIs are the only FDA-approved drug class

Estimated PTSD Market Volume (Civilian Population Only) ~14.1 million TRx*[2]



* TRx = Total prescriptions

[1] VA/DoD Clinical Practice Guideline for the Management of Post-Traumatic Stress, Version 2, 2010

[2] IMS Consulting, *Market Sizing & Treatment Dynamics: "Post-Traumatic Stress Disorder (PTSD) Patients"*, 2016

PTSD: Not Well-Served by Approved Treatments

FDA-approved SSRIs, paroxetine and sertraline, have not shown efficacy in military-related PTSD

Majority of patients unresponsive or intolerant to current treatments

- Side effects relating to sexual dysfunction (particularly in males) and sleep are commonly reported

Characteristics of an ideal drug therapy that would be compatible and complementary with behavioral therapy

- Lack of retrograde amnesia (e.g., unlike off-label use of benzodiazepines and non-benzodiazepines)
- Lack of interference on sleep (e.g., unlike approved SSRIs)

Why Initially Target Military-Related PTSD?

Military-related PTSD not well-served by existing FDA-approved therapies

- ***No clear treatment response observed in U.S. military population***

  Sertraline: failed to show efficacy in a large multicenter trial in U.S. military (placebo numerically better)[1]
  Paroxetine: no large trials conducted with predominantly military trauma

- **Inconsistent treatment response observed in males**

  Sertraline: FDA-conducted post-hoc analysis concluded no effect for male civilian subgroup[2]
  Paroxetine: no sex-related difference in treatment outcomes[3]

- **Important tolerability issues with SSRIs in this population**

  Sexual dysfunction[2,3]
  Insomnia[2,3]
  SSRI withdrawal syndrome[4]

[1] Friedman et al., J Clin Psychiatry 2007; 68:711
[2] Zoloft Package Insert, August, 2014
[3] Paxil Package Insert, June, 2014
[4] Fava et al., Psychother Psychosom 84:72-81, 2015

High Prevalence of PTSD Among Combat Veterans

3-9%
General population[1]

19-31%
Vietnam veterans[2]

>19%
Operation Enduring Freedom (OEF; Afghanistan) / Operation Iraqi Freedom (OIF) veterans / Operation New Dawn (OND)[3]

8.6 million American adults affected[1]

Women more likely to develop than men[1]

Susceptibility may **run in families**[1]

[1] Kessler et al., *Arch Gen Psych* 2005; Prevalence rate of 3.5% applied to U.S. Census estimate of 247M U.S. adult (≥18) population in 2015 (www.census.gov/quickfacts/table/PST045215/00); [2]Norris, *PTSD Res Quar*. 2013; [3]*Analysis of VA Health Care Utilization among Operation Enduring Freedom, Operation Iraqi Freedom, and Operation New Dawn Veterans, from 1st Qtr FY 2002 through 2nd Qtr FY 2015,* Washington, DC; Among 1.9M separated OEF/OIF/OND veterans, 1.2M have obtained VA healthcare; 685k evaluated by VA with possible mental disorder, and 379k diagnosed with PTSD.

Growing Economic and Social Burden to Care for Veterans with PTSD

Health care costs associated with PTSD for OEF/OIF/OND veterans:

Direct costs

$3,000-5,000
per patient per year for OEF/OIF Veterans[1]

~ 1.9M Veterans out of 2.7M
Service members deployed between 10/1/2001 and 3/31/2015[3]

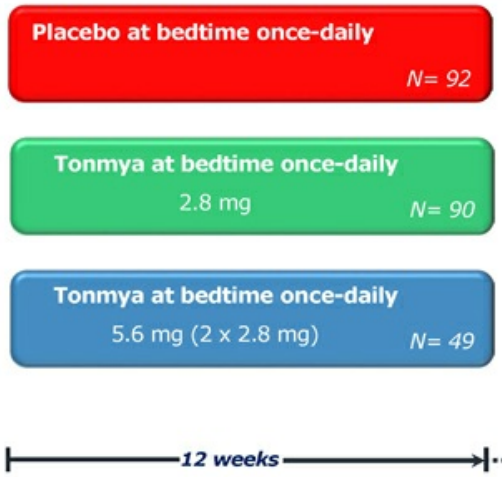
Indirect costs

$2-3 billion
estimated yearly cost to society[2]

Families, social care agencies, schools, employers, welfare system[2]

[1] CBO Report 2012; [2] Tanielan, *Invisible Wounds of War*. 2005; [3] *Analysis of VA Health Care Utilization among Operation Enduring Freedom, Operation Iraqi Freedom, and Operation New Dawn Veterans, from 1st Qtr FY 2002 through 2nd Qtr FY 2015,* Washington, DC; OEF/OIF/OND, Operations Enduring Freedom, Iraqi Freedom and New Dawn.

Phase 2 AtEase Study in Military-Related PTSD



- Randomized, double-blind, placebo-controlled trial in military-related PTSD
- Efficacy analysis from 231 patients; 24 U.S. clinical sites
- Enrolled patients with baseline CAPS-5 ≥ 29
- Primary Efficacy Analysis:
  - Difference in CAPS-5 score change from baseline between Tonmya 2.8 mg and placebo at week 12
- Key Secondary Measures:
  - PROMIS Sleep Disturbance, CGI-I, SDS

Results of Phase 2 AtEase Study in Military-Related PTSD

Tonmya 5.6 mg showed clinical benefit in military-related PTSD

- CAPS-5 scale, was statistically significant by Mixed-effect Model Repeated Measures, or MMRM, with Multiple Imputation, or MI, analysis (p-value = 0.031)
- Dose-effect on multiple efficacy and safety measurements

Well tolerated

- No serious adverse events (AE) related to treatment
- The most common AEs were local site-administration reactions, including mild and transient tongue numbness

AtEase Study Demographics and Characteristics

93% of the randomized patients were male

98% had trauma during military service

Deployed an average of 2.3 times

Mean time since index trauma was 7 years

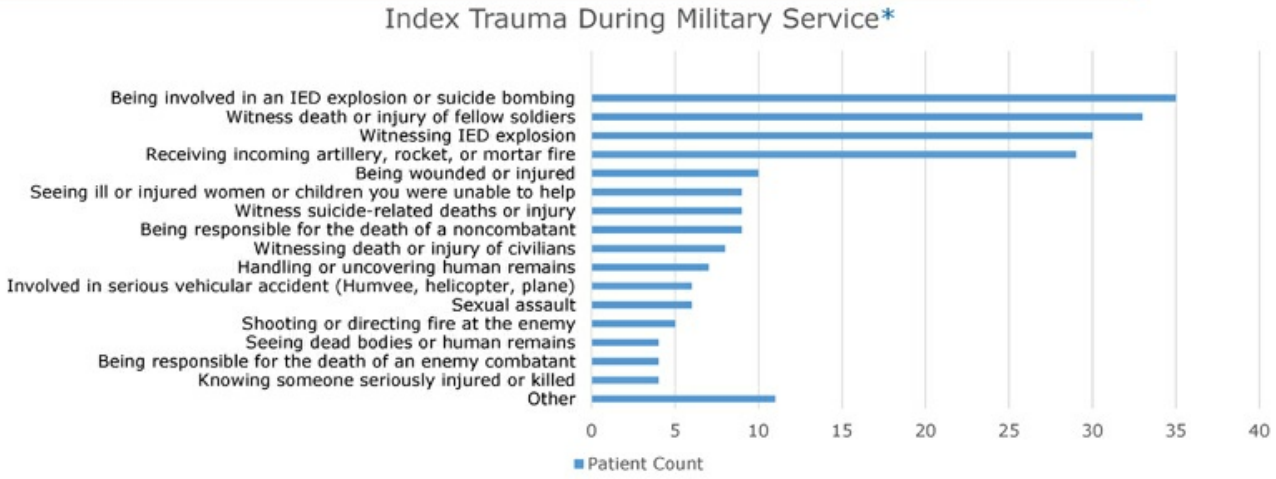
Race and ethnicity generally consistent with U.S. military distribution

Similar baseline CAPS-5 scores and MADRS[1] scores across treatment arms

Current Major Depressive Disorder 14% by MINI 7.0[2]

[1] MADRS, Montgomery-Åsberg Depression Rating Scale
[2] MINI 7.0, Mini-International Neuropsychiatric Interview, Version 7

AtEase Study: Traumas Associated with PTSD



*Some patients experienced more than one trauma

Paraesthesia	3.2%	16.1%	4.0%
Glossodynia	1.1%	3.2%	6.0%

Trial completion rates: 73% placebo; 79% Tonmya 2.8 mg; 84% Tonmya 5.6 mg

*at rates of >5% in either drug-treated arm, Safety population N=237

Assessing CAPS-5 Entry Threshold in AtEase

Score of ≥29 on CAPS-5 (20 items for severity score) required at screening and baseline

- >50 on prior versions of CAPS (17 items) typical in previous drug registration trials
- Extrapolation from prior versions of CAPS: ((50/17 items)/2) x 20 items = 29.4

***Post-hoc* analysis to impute CAPS for DSM-IV (iCAPS-IV) scores for each subject**

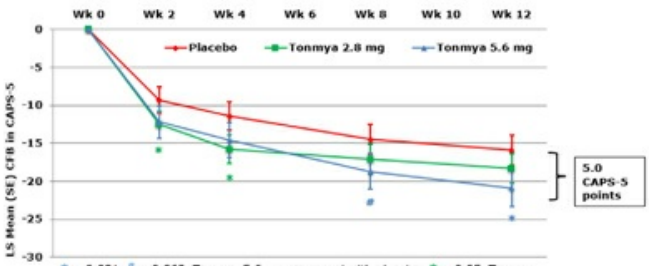
- Baseline iCAPS-IV score calculated by summing 17 items in common with CAPS-5 and multiplying by two (for 0-8 intensity + frequency rather than 0-4)
- 4.3% of the sample had baseline iCAPS-IV of ≤ 50
- Choosing CAPS-5 ≥33 results in all iCAPS-IV > 50
- 80% of mITT had baseline CAPS-5 of ≥ 33

Primary analysis of AtEase was run for subgroup with baseline CAPS-5 ≥ 33

AtEase
Total CAPS-5 for Intention-to-Treat Population and Retrospective Analysis for Subgroup with Entry CAPS-5 ≥33

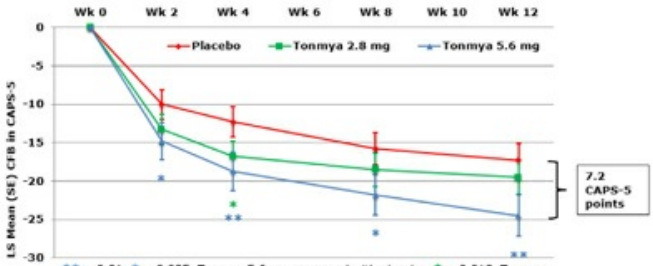
CAPS-5 LS Total Score Mean Change from Baseline (CFB)

Intention-to-Treat Population



*p=0.031, #p=0.063, Tonmya 5.6 mg compared with placebo; *p<0.05, Tonmya 2.8 mg compared with placebo; analysis is mixed-effect model repeated measures (MMRM) with multiple imputation (MI); CAPS-5, Clinician-Administered PTSD Scale for DSM-5; LS, least squares; SE, standard error.

Subgroup with entry CAPS-5 ≥33



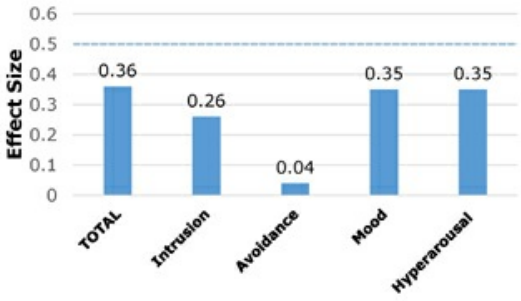
**p<0.01, *p<0.025, Tonmya 5.6 mg compared with placebo; *p=0.018, Tonmya 2.8 mg compared with placebo; analysis is MMRM with MI; LS, least squares; SE, standard error.

A baseline CAPS-5 score ≥33 was set as the PTSD severity inclusion criterion in Phase 3 HONOR study

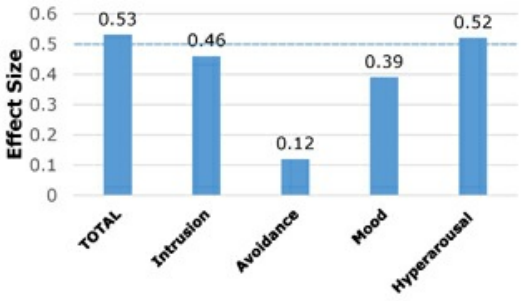
AtEase

Effect Sizes for Total CAPS-5 and Symptom Clusters for Intention-to-Treat Population and Subgroup with Entry CAPS-5 ≥33

Effect Sizes of Tonmya 5.6 mg in AtEase Intention-to-Treat Sample



Effect Sizes in Tonmya 5.6 mg in AtEase Subgroup with Entry CAPS-5 ≥33



- Note larger effect sizes, in moderate range of 0.5, for total CAPS-5 and intrusion and hyperarousal clusters in subgroup

A baseline CAPS-5 score ≥33 was set as the PTSD severity inclusion criterion in Phase 3 HONOR study

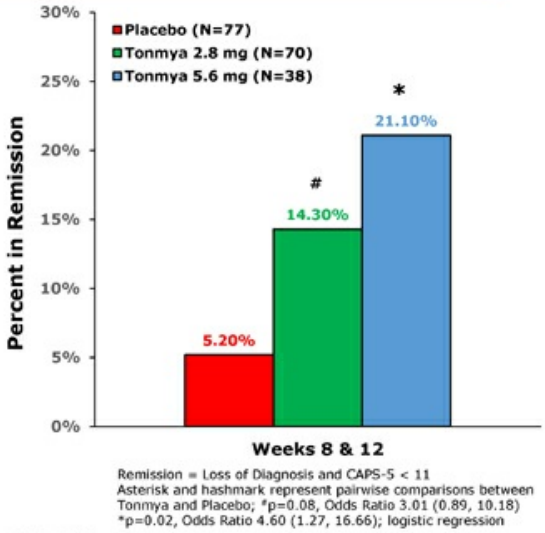
AtEase Study Retrospective Analysis:
Remission in Subgroup with Entry CAPS-5 ≥33

Remission is a clinical state that is essentially asymptomatic

In order to confirm remission:

- Determined rates of participants who met remission status at *both* Week 8 and Week 12

21% of the Tonmya 5.6 mg participants had confirmed remission v. 5% of placebo (p=0.02)



Remission = Loss of Diagnosis and CAPS-5 < 11
Asterisk and hashmark represent pairwise comparisons between Tonmya and Placebo; #p=0.08, Odds Ratio 3.01 (0.89, 10.18)
*p=0.02, Odds Ratio 4.60 (1.27, 16.66); logistic regression

TNX-102 SL – Multi-Functional Mechanism Involves Antagonism at 3 Neuronal Receptors

Active ingredient, cyclobenzaprine, interacts with 3 receptors

- Antagonist at 5-HT_{2A} receptors
  - Similar activity to trazodone and Nuplazid® (pimivanserin)
- Antagonist at α_1-adrenergic receptor
  - Similar activity to prazosin
- Antagonist at histamine H_1 receptors
  - Similar activity to Benadryl® (diphenhydramine) and hydroxyzine

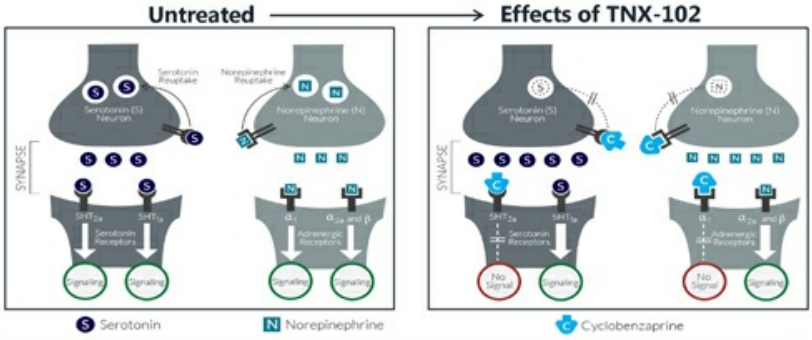
Multi-functional activity suggests potential for other indications

- TNX-102 SL was developed for the management of fibromyalgia (Phase 3)
- Sleep quality is a problem in other conditions

Cyclobenzaprine Effects on Nerve Cell Signaling

Cyclobenzaprine is a multi-functional drug - SNARI

- inhibits serotonin and norepinephrine reuptake
- blocks serotonin 5-HT_{2A} and norepinephrine α_1 receptors

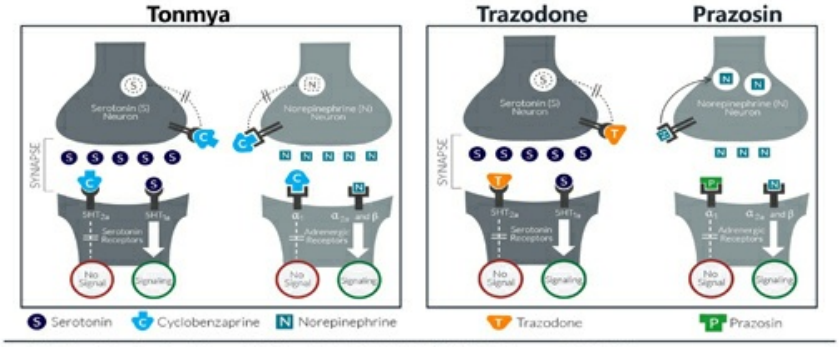


SNARI = Serotonin and Norepinephrine receptor Antagonist and Reuptake Inhibitor

Comparison of Tonmya with Drugs Used Off-Label in PTSD

Trazodone (disordered sleep), prazosin (night terrors)

- Trazodone inhibits serotonin $5HT_{2A}$ receptors and serotonin reuptake (SARI)
- Prazosin blocks norepinephrine α_1 receptors



SARI – Serotonin Receptor Antagonist & Reuptake Inhibitor (Stahl SM, CNS Spectrums, 2009;14:536).

Opportunities to Expand to Other Indications

Role of sleep disturbance more established in common psychiatric and neurological/pain disorders

- Recognized as a core symptom of many of these disorders
- Traditional sleep medications, which increase sleep quantity, may not provide benefit (benzodiazepines in major depression) or are contraindicated (benzodiazepines in PTSD)

Psychiatric Disorders

- Stress Disorders (PTSD)
- Mood Disorders
- Anxiety Disorders

Psychiatric Symptoms of Neurological Disorders

- Agitation in Alzheimer's
- Psychosis in Parkinson's, Alzheimer's and other dementias

Chronic Pain States

- Chronic wide-spread pain (fibromyalgia)
- Osteoarthritis

Growing recognition that there is a constellation of disorders where sleep disturbances may have a role in the pathophysiology (cardiovascular, metabolic, neurologic)

- Homeostatic role of sleep quality *in several disorders*

TNX-102 SL – Multiple Potential Indications

Management of Fibromyalgia (FM) – chronic pain condition

- TNX-102 SL clinical development in FM was halted after near miss in Phase 3 at low dose (2.8 mg) – half the dose being developed for PTSD
- Imbalance in "withdrawal of consent" led to statistical miss on responder analysis – a few TNX-102 SL treated patients "moved out of state"
- Average pain improvement (secondary endpoint) after 12 weeks of treatment showed statistical significance ($P < 0.05$)
- Low dose TNX-102 SL (2.8 mg) showed an improvement in sleep quality in Phase 2 and Phase 3 FM trials

Agitation in Alzheimer's Disease

- Phase 2 IND submitted March 2018
- Phase 2 study can be a pivotal efficacy study

What is Agitation in Alzheimer's Disease?

Agitation is one of the most distressing and debilitating of the behavioral complications of Alzheimer's disease

- Includes emotional lability, restlessness, irritability and aggression[1]

Link between disturbed sleep and agitation in Alzheimer's[1-3]

- Agitation is commonly diurnal ("sundowning")

Prevalence

- Agitation is likely to affect more than half of the 5.3 million Americans who currently suffer from moderate to severe Alzheimer's disease, and this number is expected to nearly triple by 2050[4]

[1]Rose, K.et al. (2015). *American Journal of Alzheimer's Disease & Other Dementias*, *30*:78
[2]Shih, Y. H., et al. (2017). *Journal of the American Medical Directors Association*, *18*, 396.
[3]Canevelli, M., et al. (2016). *Frontiers in medicine*, *3*.
[4]The Alzheimer's Association, 2017 Alzheimer's Disease Facts and Figures: https://www.alz.org/facts/

Consequences of Agitation in Alzheimer's Disease

Outcomes

- Agitation is associated with significant poor outcomes for Alzheimer's patients and challenges for their caregivers

Common reason for institutionalization

- Development of agitation, or its worsening, is one of the most common reasons for patients having to transition from lower- to higher levels of care (nursing homes and other long-term care settings)[1]

Cost

- The presence of agitation nearly doubles the cost of caring for patients with Alzheimer's disease, and agitation is estimated to account for more than 12% of the healthcare and societal cost of Alzheimer's disease, which is currently estimated to be $256 Billion for the year 2017 in the United States[1]

[1]The Alzheimer's Association, 2017 Alzheimer's Disease Facts and Figures: https://www.alz.org/facts/

Agitation in Alzheimer's Disease – Potential New Indication for TNX-102 SL

Successful pre-IND meeting in November, 2017

- Phase 2 IND submitted March 2018

Significant unmet need

- No FDA approved drugs for the treatment of agitation in Alzheimer's

Mechanism of improving sleep quality

- Sleep disturbance is a significant and common symptoms in Alzheimer's

Pharmacological advantages outweigh potential concerns of using TNX-102 SL in treating agitation in Alzheimer's disease

- Blocks 3 receptors, not just one (e.g., 5-HT_{2A})
- Anti-muscarinic (M1) effect in patients on anticholinergics (e.g., donepezil and rivastigmine) possibly reduced with lower sublingual dose

TNX-102 SL for Agitation in Alzheimer's – Regulatory Status and Registration Strategy

FDA confirmed no additional study is needed prior to IND submission

- Pre-IND meeting established open dialogue with the FDA on pivotal clinical study design and efficacy endpoints to support product registration

Phase 2 IND submitted in March 2018

- Proposed Phase 2 IND study can potentially serve as a pivotal efficacy study

Potential approval of TNX-102 SL in agitation in Alzheimer's disease

- Efficacy Supplement (sNDA[1]) may be leveraged from the PTSD development program and supported by Initial NDA approval for PTSD

[1]Supplemental New Drug Application

Scientific Rationale for Developing TNX-102 SL for Agitation in Alzheimer's Disease

Connection between Sleep Disturbance and Agitation

- Agitation in Alzheimer's Disease is associated with sleep disturbance[1,2]
- Evidence that improving sleep could improve agitation[3]

Supported by Potential Mechanism of Action

- TNX-102 is a multifunctional agent including antagonism of 5-HT_{2A}, α_1-adrenergic and histamine H_1 receptors
- Certain 5-HT_{2A} antagonists have shown clinical efficacy against agitation in dementia including trazodone[4,5], and mirtazapine[6]
- The α_1-adrenergic antagonist prazosin has shown efficacy in the treatment of agitation in dementia[7]
- The histamine H_1 antagonist hydroxyzine had historical use in treating agitation in dementia[8]

TNX-102 SL Potentially Addresses Some of the Challenges in Treating Agitation in Alzheimer's

Sublingual route of administration (no swallowing)

- Swallowing can be an issue for a significant number of Alzheimer's patients

Low dose taken daily at bedtime

- Potentially minimize daytime anticholinergic side effects → improved tolerability and patient compliance

Role of sleep in clearing debris from the brain

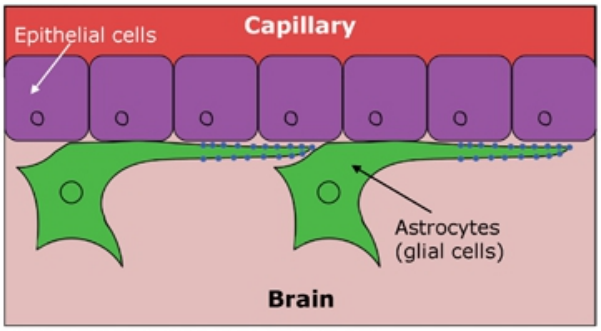
- Animal studies have shown debris clearance from the brain during sleep including toxic proteins associated with Alzheimer's progression[1]

[1]T Xie L, et al. Science. (2013);342(6156):373

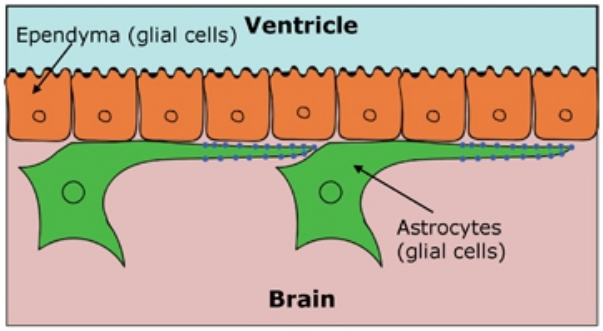
Protective Barriers in the Central and Peripheral Nervous Systems

Glial cells are cells that reside in the central nervous system and can provide protective barriers between the central and peripheral nervous systems[1,2]

Blood–Brain Barrier:
supplies nutrients to the brain and filters toxins[1]



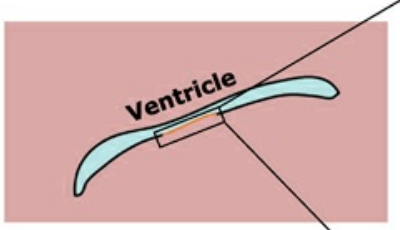
Cerebrospinal Fluid (CSF)–Brain Barrier/Glymphatic System:
extracts toxins from the brain[2]



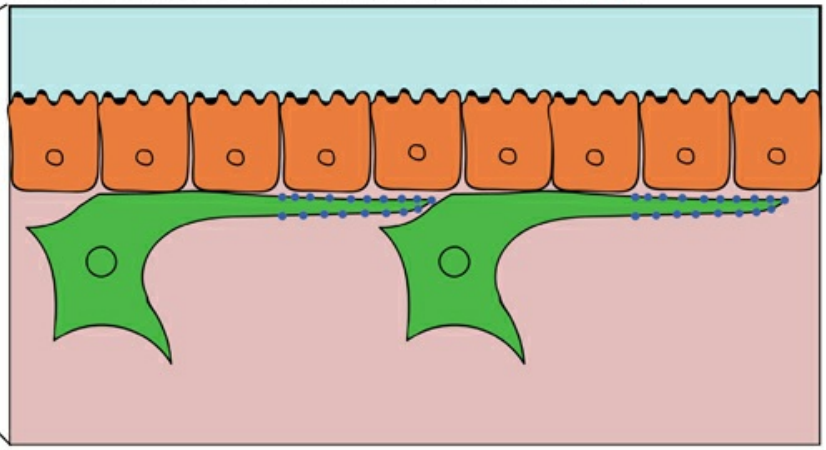
1. Ballabh P, et al. *Neurobiol Dis.* 2004;16(1):1-13.
2. Jessen NA, et al. *Neurochem Res.* 2015;40(12):2583-2599.

During Wakefulness, Proteins Linked to Neuronal Death and Neurodegeneration Accumulate in the Brain's Extracellular Space

CSF recirculates through the brain cerebral cortex through ventricles[1]



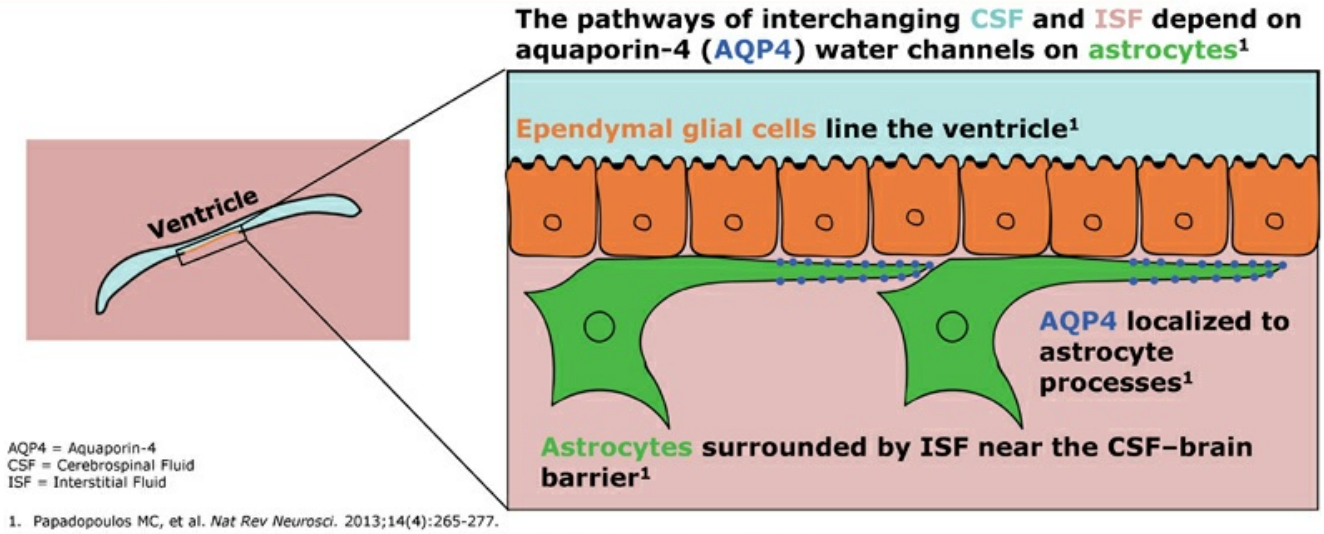
During wakefulness, there is a high barrier to CSF interchanges with the interstitial fluid (ISF)[1]



CSF = Cerebrospinal Fluid
ISF = Interstitial Fluid

1. Papadopoulos MC, et al. *Nat Rev Neurosci.* 2013;14(4):265-277.

During Wakefulness, Proteins Linked to Neuronal Death and Neurodegeneration Accumulate in the Brain's Extracellular Space

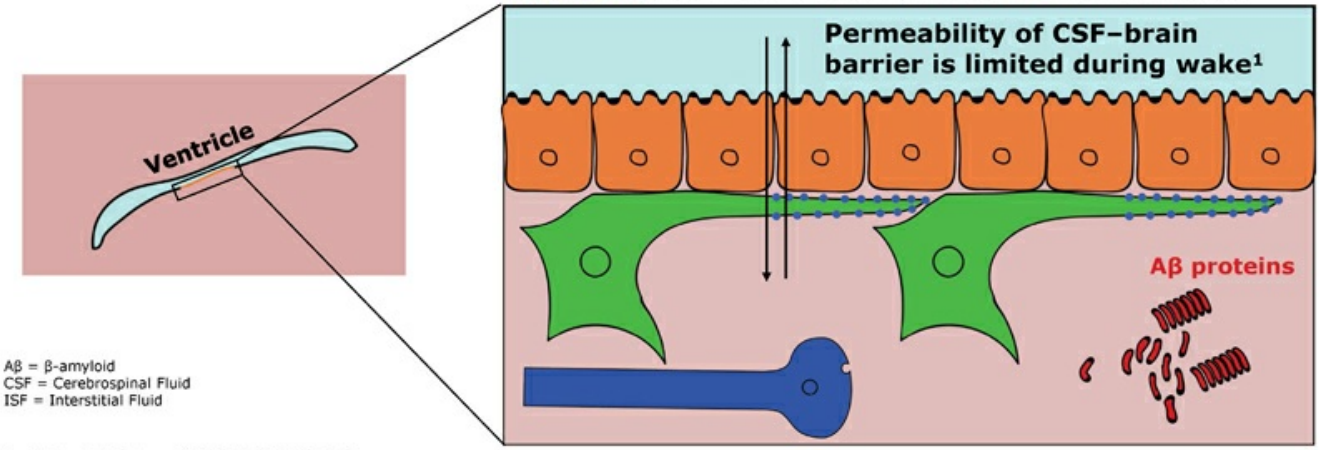


AQP4 = Aquaporin-4
CSF = Cerebrospinal Fluid
ISF = Interstitial Fluid

1. Papadopoulos MC, et al. *Nat Rev Neurosci.* 2013;14(4):265-277.

During Wakefulness, Proteins Linked to Neuronal Death and Neurodegeneration Accumulate in the Brain's Extracellular Space

Aβ proteins linked to neurodegenerative diseases and neuronal death are present in the ISF during wake[1]

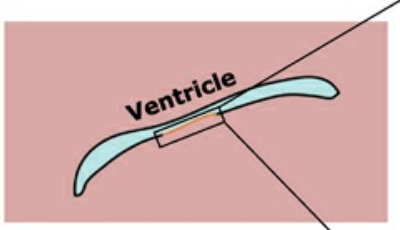


Aβ = β-amyloid
CSF = Cerebrospinal Fluid
ISF = Interstitial Fluid

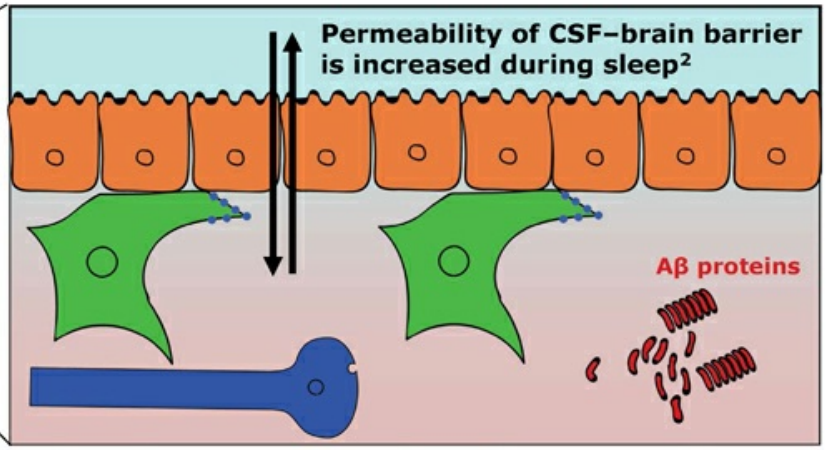
1. Xie L, et al. *Science*. 2013;342(6156):373-377.

During Sleep, the CSF–Brain Barrier Is More Permeable, Allowing Debris to Clear

Extracellular volume increases during sleep[2]



Astrocytes change shape, promoting fluid exchange[1]

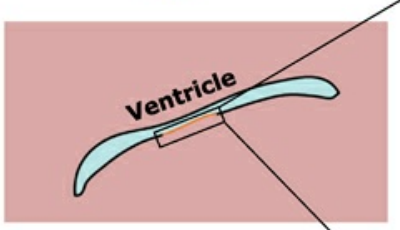


Aβ = β-amyloid
CSF = Cerebrospinal Fluid

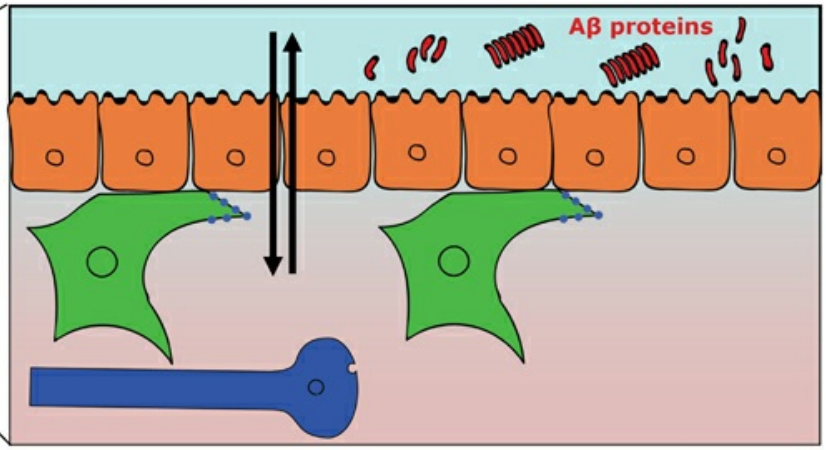
1. Bellesi M, et al. *BMC Biol*. 2015;13:66.
2. Xie L, et al. *Science*. 2013;342(6156):373-377.

During Sleep, the CSF–Brain Barrier Is More Permeable, Allowing Debris to Clear

CSF interchanging with ISF removes interstitial proteins, including Aβ[1]



Astrocytes change shape, promoting fluid exchange[1]



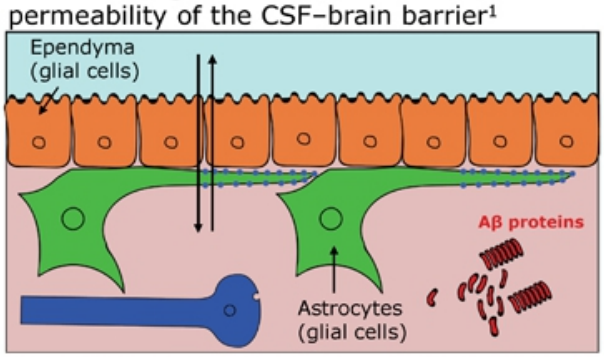
Aβ = β-amyloid
CSF = Cerebrospinal Fluid
ISF = Interstitial Fluid

1. Xie L, et al. *Science*. 2013;342(6156):373-377.

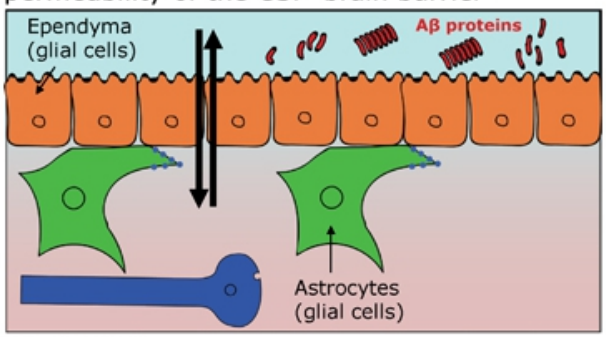
Sleep–Wake Cycles Alter Permeability of the CSF–Brain Barrier

Fluid exchange at the CSF–brain barrier allows for clearance of toxic proteins called β–amyloids (Aβ).[1] Glial cells in the brain work to facilitate this fluid exchange.[2] Sleep–wake cycles alter glial cell morphology, which may affect fluid exchange at the CSF–brain barrier.[3]

Wakefulness:
Fluid exchange is reduced due to limited permeability of the CSF–brain barrier[1]



Sleep:
Fluid exchange is increased due to greater permeability of the CSF–brain barrier[1]



1. Xie L, et al. *Science*. 2013;342(6156):373-377. 2. Papadopoulos MC, et al. *Nat Rev Neurosci*. 2013;14(4):265-277.
3. Bellesi M, et al. *BMC Biol*. 2015;13:66.

Agitation in Alzheimer's – Competitive Landscape of Select Drugs in Development

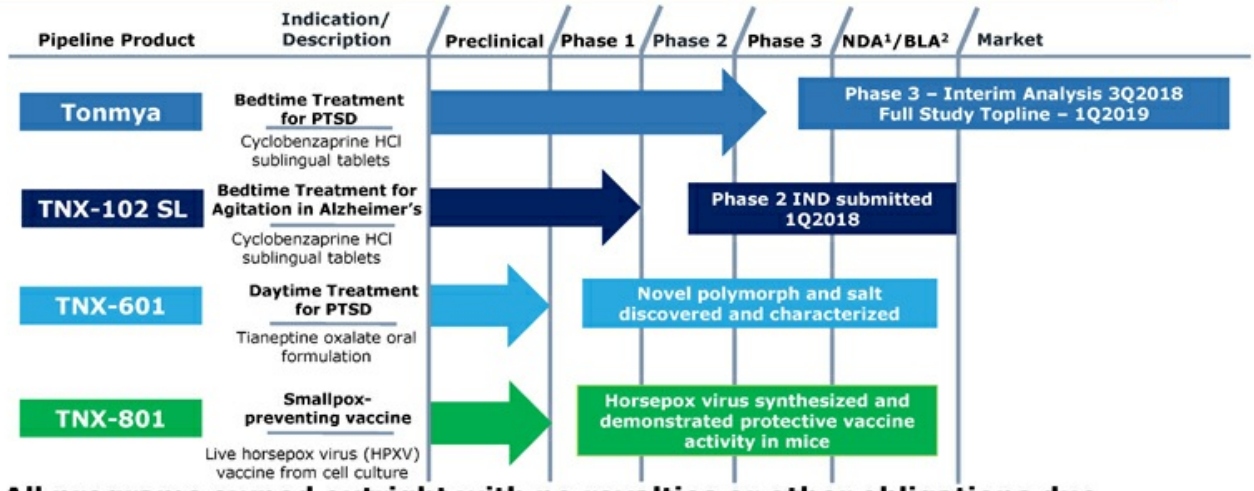
Competitive landscape

- $5HT_{2A}$ Antagonists/inverse agonists
  - Nelotanserin (Axovant)
- Atypical Antipsychotics (also have $5HT_{2A}$ antagonism)
  - Rexulti® brexpiprazole (Otsuka/Lundbeck)
  - Lumateperone (InterCellular)
- Dextromethorphans – believed to act as SSRI, glutamate/NMDA and sigma-1 receptor modulators
  - Deudextromethorphan (Avanir/Otsuka) - deuterated version of Nuedexta®
  - Dextromethorphan/bupropion (Axsome Therapeutics)

TNX-102 SL uniquely designed for bedtime dosing and transmucosal absorption

- Maximize drug exposure during sleep → improving sleep quality
- Other 5-HT_{2A} antagonists not designed for bedtime sublingual dosing

Candidates in Development



All programs owned outright with no royalties or other obligations due

[1]NDA- New Drug Application; [2]BLA –Biologic Licensing Application; [3]Investigational New Drug Application

TNX-601 (Tianeptine Oxalate): A Potential Clinical Candidate for PTSD

Pre-IND Candidate

Targeting a Condition with Significant Unmet Need

Targeted as a 1st line monotherapy for PTSD: oral formulation for daytime dosing

- ✓ **Leverages expertise in PTSD (clinical and regulatory experience, market analysis, etc.)**
- ✓ **Mechanism of Action (MOA) is different from Tonmya**

- Tianeptine sodium (amorphous) has been approved in EU, Russia, Asia and Latin America for depression since 1987 with established post-marketing experience
- Identified new oxalate salt polymorph with improved pharmaceutical properties ideal for reformulation

Filed patent application on novel salt polymorph

- Issued patent on steroid-induced cognitive impairment and memory loss issues

Clinical evidence for PTSD

- Several studies have shown tianeptine to be active in the treatment of PTSD[1-4]

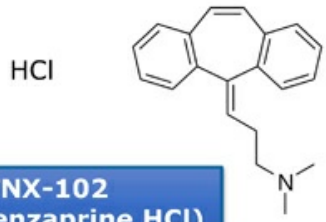
[1] Frančišković T, et al. Psychiatr Danub. 2011 Sep;23(3):257-63. PMID: 21963693
[2] Rumyantseva GM and, Stepanov AL. Neurosci Behav Physiol. 2008 Jan;38(1):55-61. PMID: 18097761
[3] Aleksandrovskiĭ IA, et al. Zh Nevrol Psikhiatr Im S S Korsakova. 2005;105(11):24-9. PMID: 16329631 [Russian]
[4] Onder E, et al. Eur Psychiatry. 2006 (3):174-9. PMID: 15964747

Structural Comparison: TNX-102 and TNX-601

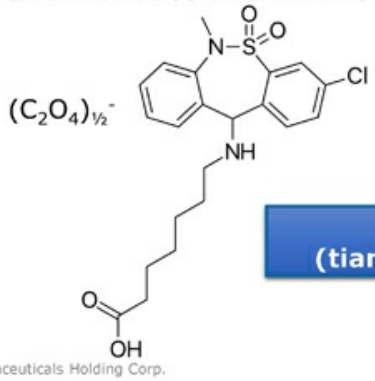
Cyclobenzaprine and tianeptine share structural similarities with classic tricyclic antidepressants (TCAs) and to each other, but each has unique pharmacological properties

- Tianeptine has a 3-chlorodibenzothiazepine nucleus with an aminoheptanoic side chain

Tianeptine leverages Tonix's expertise in the pharmacology and development of tricyclics



TNX-102 (cyclobenzaprine HCl)



TNX-601 (tianeptine oxalate)

TNX-801 (Synthesized Live Horsepox Virus): A Smallpox-Preventing Vaccine Candidate

Pre-IND Stage

Potential improvement over current biodefense tools against smallpox

- ✓ Leverages Tonix's government affairs effort
- ✓ Collaboration with Professor David Evans and Dr. Ryan Noyce at University of Alberta
- ✓ Demonstrated protective vaccine activity in mice
- ✓ Patent application on novel vaccine submitted

Regulatory strategy

- We intend to meet with FDA to discuss the most efficient and appropriate investigational plan to support the licensure, either:
  - ✓ Application of the "Animal Rule", or
  - ✓ Conducting an active comparator study using ACAM2000
- Good Manufacturing Practice (GMP) viral production process in development

Targeting a Potential Public Health Issue

Material threat medical countermeasure under 21st Century Cures Act

- Qualifies for **Priority Review Voucher* (PRV)** upon licensure
  - ✓ **PRVs have no expiration date, are transferrable and have sold for ~$125 M**

[1]PRV can be applied to any BLA/NDA for priority 6-month review

TNX-801 (Synthesized Live Horsepox Virus): A Smallpox-Preventing Vaccine Candidate

Synthesis[1] from sequence of a 1976 Mongolian isolate[2]

In mice, TNX-801 behaved like attenuated vaccinia virus

- Vaccinia is the term used to classify the live poxviruses that are used as smallpox vaccines, including ACAM2000, which is the latest smallpox vaccine licensed in the U.S.

How is HPXV related to modern vaccines?

- Multiple sources[3-5] indicate that the smallpox vaccine discovered by Dr. Edward Jenner in the early 19th century was either HPXV or a very similar virus and that vaccinia vaccines are derived from this ancestral strain
- A 1902 U.S. smallpox vaccine was found to be highly similar (99.7% similarity in core genome[6]) to HPXV sequence from the 1976 Mongolian isolate
- Horsepox is now believed to be extinct[5]

The Currently Licensed Smallpox Vaccine ACAM2000 is a Live Vaccinia Virus (VACV) Vaccine

ACAM2000 is sold to the U.S. Strategic National Stockpiles[1]

- Sold by Emergent BioSolutions
- Sanofi divested ACAM2000 to Emergent BioSolutions in 2017 for $97.5 M upfront plus milestones
- ACAM2000 was developed by Acambis which was acquired by Sanofi in 2008 for $513 M

Vaccinia (VACV) strains have demonstrated potential for zoonotic infections and re-infection of humans[2-5]

- No known evidence for zoonosis of ACAM2000, but it has not been widely administered

Modern VACV smallpox vaccines are associated with cardiotoxicity[6]

HPXV or TNX-801– May Have an Improved Safety Profile as a Smallpox Preventing Vaccine

Horsepox is caused by HPXV and is characterized by mouth and skin eruptions

HXPV isolate from the 1976 outbreak later sequenced

Modern smallpox vaccines are associated with cardiotoxicity[1]

HPXV has potential for slower proliferation leading to possibly decreased toxicity[2]

[1] Engler RJM et al., PloS ONE 10(3): e0118283. doi:10.1371/journal.pone.0118283 (2015)
[2] Noyce, RS, Lederman S, Evans DH. PLoS ONE. 2018; 13(1): e0188453 https://doi.org/10.1371/journal.pone.0188453

An Improved Smallpox-Preventing Vaccine is Important and Necessary for a Potential Public Health Issue

Smallpox was eradicated as a result of global public health campaigns

No cases of naturally-occurring smallpox have been reported since 1977

Accidental or intentional transmission of smallpox does not require a natural reservoir

Stockpiles of smallpox-preventing vaccines are currently maintained and refreshed in case of need

Current Needs to Vaccinate Against Smallpox

Ongoing vaccination of U.S. troops

- Troops in the Global Response Force

Threat of smallpox re-introduction

- Strategic National Stockpile & public health policy

Re-emergence of monkey pox[1]

- Believed to resurgent because of vaccinia-naïve populations in Africa
- Multiple U.S. military operations ongoing in Africa

[1]Nda- Isaiah, J. Nigeria: Monkey Pox Scourge Spreads to Seven States. All Africa. 12 OCTOBER 2017, HTTP://ALLAFRICA.COM/STORIES/201710120177.HTML

TNX-801: A Potential Medical Countermeasure

21st Century Cures Act (2016), Section 3086

- Encouraging treatments for agents that present a national security threat

Medical countermeasures are drugs, biologics (vaccines) or devices intended to treat:

- Biological, chemical, radiological, or nuclear agents that present a national security threat
- Public health issues stemming from a naturally occurring emerging disease or a natural disaster

New Priority Review Voucher program for "Material Threat Medical Countermeasures"

- Priority Review Voucher may be transferred or sold

TNX-801 (Synthesized Live Horsepox Virus): A Smallpox-Preventing Vaccine Candidate

TNX-801 (HPVX)

- Synthesized live horsepox virus
- Shares structural characteristics with vaccinia-based smallpox vaccines
- Unique properties that suggest lower toxicity

Mechanism of Action

Live virus vaccines stimulate cross-reactive immunity

- Protects from possible infection with smallpox virus
- Renders recipient "immune"
- Provides indirect protection to non-immunized population "herd immunity"

Possible advantages of TNX-801

Potential safety improvement over existing vaccines

- Cardiotoxicity limits widespread smallpox vaccination in at-risk population

Exclusivity

- Patent application filed on novel virus composition
- 12 years exclusivity can be anticipated

Eligibility for Priority Review Voucher upon licensure if accepted as medical counter-measure

Evidence of Effectiveness for Smallpox Vaccine

Given that smallpox is eradicated the only evidence of effectiveness for modern vaccines is from historical use when smallpox was endemic

- Stimulates interest in the evolution of vaccinia

Vaccinia stocks around the world diverged from Jenner's 1798 vaccine

- Evolutionary argument that common progenitor was horsepox or a similar virus

U.S. vaccine from 1902 was found to be 99.7% similar to horsepox in core viral sequence[1]

- Strong evidence linking a horsepox-like virus as progenitor to modern vaccinia
- Effectiveness of older vaccines support belief that HPXV will be protective against smallpox

[1]Schrick, L. et al (2017) An Early American Smallpox Vaccine Based on Horsepox N Engl J Med 2017; 377:1491

ACAM2000[1] – Best Technology of its Time

Single clone picked from "swarm" of Dryvax®[1]

- Some rationale for selection[2]

Growth in serum free Vero cells

- Eliminates risk of Bovine Spongiform Encephalopathy (BSE)/prion contamination – safety concerns in Wyeth's Dryvax (grown in calf lymph)

In 2000, the evolutionary connection between vaccinia and horsepox was not understood

- Tulman's sequence of horsepox was published in 2006[3]

[1]US licensed smallpox preventing vaccine – ACAM2000 is currently marketed, Dryvax has been withdrawn from marketing
[2]Monath, TP et al. Int. J. of Inf. Dis. (2004) 8S2:S31
[3]Tulman, ER. Genome of Horsepox Virus J. Virol. (2006) 80(18) 9244

Rationale for Developing a Potentially Improved New Smallpox Vaccine

Toxicity concern of modern vaccinia (VACV) vaccines limit wildly administration

- Not recommended for use, even in first responders
- U.S. soldiers in the Global Response Force are immunized

Modern VACV vaccination safety studied in 1081 VACV (Dryvax [62.5%] and ACAM2000 [37.5%]) vaccinees[1]

- New onset chest pain, dyspnea and/or palpitations 10.6% of VACV-vaccinees and 2.6% of control immunized (TIV)[2]
- Clinical: 4 probable myo- and 1 suspected peri-carditis (5 cases out of 1081 VACV vaccinees – 0.5%)
- Cardiac specific troponin T (cTnT) elevation in 31 VACV vaccinees (3%)

[1]Engler RJM,, et al. (2015) A Prospective Study of the Incidence of Myocarditis/Pericarditis and New Onset Cardiac Symptoms following Smallpox and Influenza Vaccination. PLoS ONE 10(3)

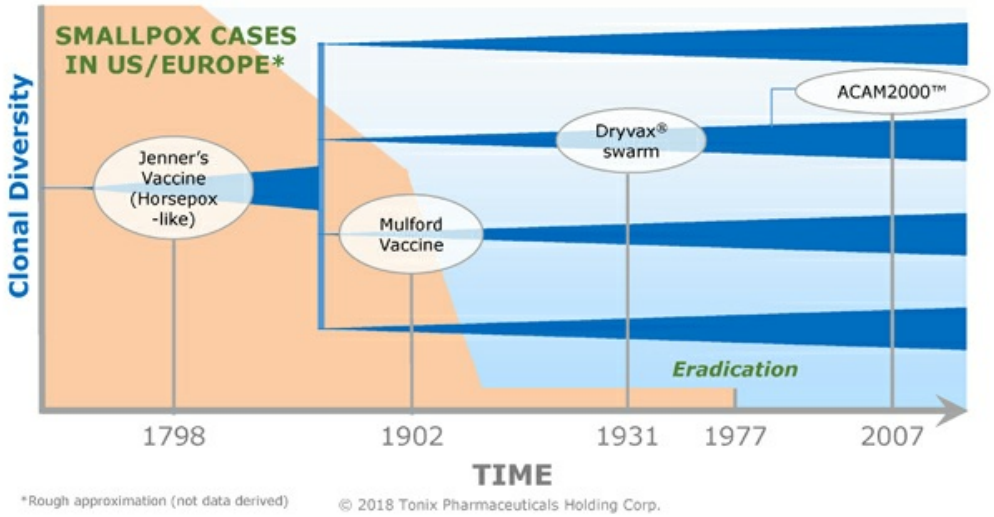
Figure Adapted from Qin et al. *Journal of Virology*. 2015;89(3):1809-1824.

Proposed Evolution of Vaccinia Vaccines

Relationship to Smallpox Incidence and Eradication



*Rough approximation (not data derived)

What's the Evidence of Effectiveness of Smallpox Vaccines for Preventing Smallpox?

Theoretical effectiveness of modern vaccinia vaccines are based on extrapolation from older vaccines

- Newer/modern vaccines were not widely used when smallpox was endemic

MVA (Modified Virus Ankara) which has large deletions also produces different T cell responses

- In non-human primates, MVA is less effective than ACAM2000 in protecting against monkeypox[1]
- MVA has fewer epitopes, and elicits different responses to existing epitopes[2]
  - MVA effectiveness argument is based on the immune response to intracellular mature virus (IMV)
  - Immunity to the other form of virus, extracellular enveloped virus (EEV), is weak because the immunodominant B5 gene is heavily mutated and deleted in MVA

[1]Golden JW, et al. (2012). PLoS ONE 7(7): e42353. doi:10.1371/journal.pone.0042353
[2]Tscharke, DC et al., J. Exp. Med. 2005 201(1):95

Possible Smallpox Prevention and Treatment Strategies

Preventing Vaccine

- Jenner's vaccine, HPXV (upon licensure), Vaccinia

Post-exposure vaccination[1]

- Jenner's vaccine

Priming of the immune system

- Imvamune® (MVA) and DNA vaccines[2]

Pharmacotherapy for infected or exposed individuals

- Arestvyr®/TPOXX® (tecovirimat, formerly ST-246)

Treatment of disseminated viremia in immunocompromised[3]

- Arestvyr®/TPOXX®, Brincidofovir and vaccinia immune globulin

[1]Described by Jenner as one of his major discoveries
[2]Hooper, JW et al. Smallpox DNA Vaccine Protects Nonhuman Primates Against Lethal Monkeypox. J. Virol. 2004. 78 (9) 4433
[3]Lederman, ER et al, Progressive Vaccinia: Case Description and Laboratory-Guided Therapy With Vaccinia Immune Globulin, ST-246, and CMX001 JID 2012. 206:1372

Viral Replication Proficiency is Critical to Human Immunogenicity but May Compromise Safety

Pox vaccines with low or no replication appear safer than vaccines replicate fast in human cells

- Canarypox and Imvamune® (Modified Virus Ankara/MVA) appear to have good tolerability
- Relatively safe in immunocompromised hosts
- Rapidly replicating modern vaccinia vaccines (Dryvax® and ACAM2000®) are associated with myocarditis

Replication correlates positively with immunogenicity

- Jenner's vaccine and modern vaccinia engender strong immunity
- Canarypox and MVA appear to be weak immunogens, suitable for priming of the immune system in healthy human being and potentially safe enough to use in immunocompromised people

Manufacturing and Dosing Requirements

TNX-801 (HPXV) is expected to have similar scalability for mass production as ACAM2000

- TNX-801 grows well in cell lines – immunity is expected after single administration (immunization)
- Only a small dose (replicating live virus) is required for immunization

MVA is hard to scale up for commercial production

- Requires high dose* to engender an immune response (non-replicating virus)
- Cumbersome immunization schedule– two doses, 4 weeks apart, are used typically to prime the immune system (slow growth)

Antivirals

- Relatively expensive to manufacture – requires repeated dosing
- May provide logistical challenges to at risk population over the at risk period

Rationale for Developing a Potentially Improved New Smallpox Vaccine Based on Jenner's Vaccine

Vaccination protects against smallpox – both individuals and populations at risk

- Use of Jenner's vaccine resulted in eradication of smallpox

Vaccination can protect AFTER smallpox infection

- Vaccinia can be administered 1-3 days after infection

Vaccination indirectly protects non-immunized people in a population

- "Wetting the forest" or "herd immunity"

Vaccination can be cost effective with safe/low-risk vaccines

- Replication-efficient live virus vaccines can be manufactured and administered for broader use

"The Time is Right"

New synthetic biology technology and new understanding of vaccinia evolution provide an opportunity for a potentially safer vaccine using HPXV

Potential for Use of HPXV as a Vector for Vaccines to Infectious Disease or Cancer

Poxviruses like HPXV can be engineered to express foreign genes and are well recognized platforms for vaccine development

- Large packaging capacity for exogenous DNA inserts (i.e. encoding antigens)
- Precise virus-specific control of exogenous gene insert expression
- Lack of persistence or genomic integration in the host
- Strong immunogenicity as a vaccine
- Ability to rapidly generate vector/insert constructs
- Readily manufacture at scale
- Live, replicating vaccine – direct antigen presentation

Potential advantages of HPXV- strong immunogenicity with good tolerability

Milestones – Recently Completed and Upcoming

Tonmya – Posttraumatic Stress Disorder

☑	May 2016	Reported results from Phase 2 AtEase study
☑	August 2016	End-of-Phase 2 meeting with FDA - Proposed Phase 3 clinical and NDA plan accepted
☑	December 2016	Breakthrough Therapy designation granted by FDA
☑	January 2017	FDA concurrence with Phase 3 HONOR study design in military-related PTSD
☑	1Q 2017	Initial Cross-disciplinary Breakthrough Meeting with FDA
☑	1Q 2017	Commenced enrollment of HONOR study
☑	2Q 2017	U.S. Patent No. 9,636,408 issued for eutectic formulation of Tonmya
☑	3Q 2017	European Patent No. 2,501,234 issued for TNX-102 method of use
☑	4Q 2017	Japan patent No. 6259452 issued for TNX-102 SL pharmacokinetics
☑	1Q 2018	Notice of Allowance for U.S. Patent Application 12/948,828 TNX-102 method of use
☑	2Q 2018	Randomization of 50% of HONOR study participants
☐	3Q 2018	Anticipated interim analysis of HONOR study in ~275 randomized participants
☐	1Q 2019	Anticipated topline results of HONOR study in ~550 randomized participants (if needed)

Summary

Near term milestones in Phase 3 program PTSD focused on military-related PTSD

- Major unmet need; 8.6 Million Americans affected
- Potential for NDA approval based on one study

New indication for agitation in Alzheimer's Disease

- Phase 2 IND submitted 1Q 2018

New day-time PTSD therapy in development

- Leverages development expertise in PTSD, i.e., trial recruitment and execution

New vaccine in development to prevent Smallpox

- Opportunity to supply stockpiling requirement; short development path
- Studies in mice suggest improved safety profile

TONIX PHARMACEUTICALS

Cautionary Note on Forward-Looking Statements

Certain statements in this presentation regarding strategic plans, expectations and objectives for future operations or results are "forward-looking statements" as defined by the Private Securities Litigation Reform Act of 1995. These statements may be identified by the use of forward-looking words such as "anticipate," "believe," "forecast," "estimate" and "intend," among others. These forward-looking statements are based on Tonix's current expectations and actual results could differ materially. There are a number of factors that could cause actual events to differ materially from those indicated by such forward-looking statements. These factors include, but are not limited to, substantial competition; our need for additional financing; uncertainties of patent protection and litigation; uncertainties of government or third party payor reimbursement; limited research and development efforts and dependence upon third parties; and risks related to failure to obtain U.S. Food and Drug Administration clearances or approvals and noncompliance with its regulations. As with any pharmaceutical under development, there are significant risks in the development, regulatory approval and commercialization of new products. The forward-looking statements in this presentation are made as of the date of this presentation, even if subsequently made available by Tonix on its website or otherwise. Tonix does not undertake an obligation to update or revise any forward-looking statement, except as required by law. Investors should read the risk factors set forth in the Annual Report on Form 10-K for the year ended December 31, 2017, as filed with the Securities and Exchange Commission (the "SEC") on March 9, 2018, and periodic reports filed with the SEC on or after the date thereof. All of Tonix's forward-looking statements are expressly qualified by all such risk factors and other cautionary statements.

Tonix Development Highlights

Cyclobenzaprine Sublingual Tablets

Lead Program Tonmya®[1] - FDA Breakthrough Therapy in PTSD[2]
- Phase 3 HONOR study enrolling- bedtime treatment for PTSD

TNX-102 SL[3] - Bedtime treatment for agitation in Alzheimer's disease
- Phase 2 IND submitted in March 2018

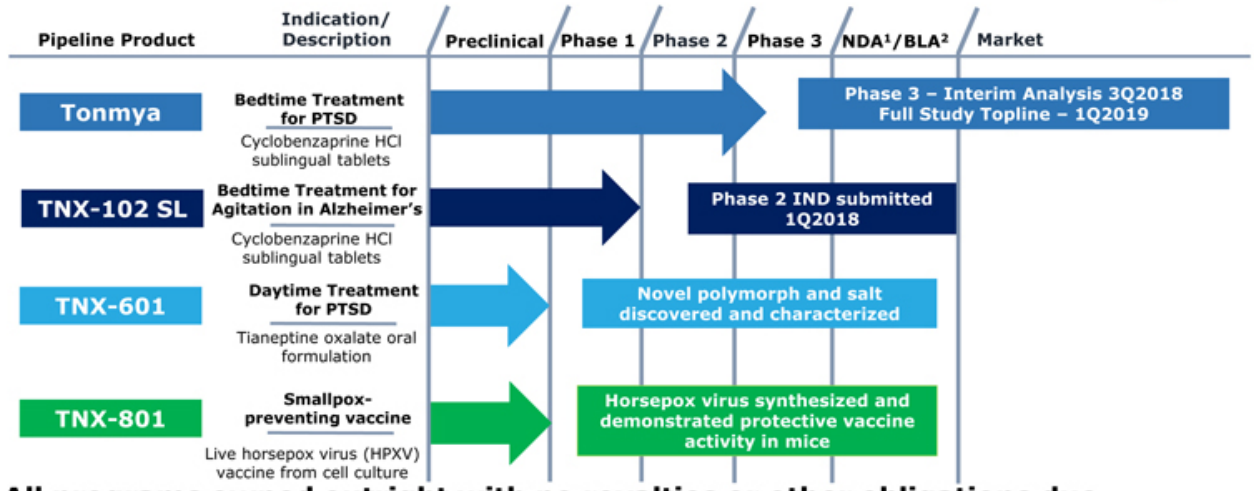
Pipeline

TNX-601[4] - Pre-IND candidate for daytime treatment for PTSD
- Nonclinical development ongoing

TNX-801[5] - Smallpox-preventing vaccine candidate
- Efficacy demonstrated in mice model
- cGMP process development underway

[1] Tonmya has been conditionally accepted by the U.S. FDA as the proposed trade name for TNX-102 SL (cyclobenzaprine HCl sublingual tablets) for PTSD. Tonmya is an investigational new drug and has not been approved for any indication.
[2] PTSD = Posttraumatic stress disorder
[3] TNX-102 SL is an investigational new drug and has not been approved for any indication.
[4] Tianeptine oxalate
[5] Synthesized live horsepox virus

Candidates in Development



All programs owned outright with no royalties or other obligations due

[1]NDA- New Drug Application; [2]BLA –Biologic Licensing Application; [3]Investigational New Drug Application

Tonmya for PTSD

Phase 3 HONOR study in military-related PTSD enrolling

- Encouraging evidence of safety and efficacy was demonstrated in Phase 2
- Higher entry CAPS-5 criterion used in Phase 3[1]

Breakthrough Therapy designation from the FDA

- Expedited development and accelerated approval are expected

Proposed registration plan agreed to by the FDA

- Potential NDA[2] approval based on one Phase 3 study

Patent protection through 2034 in U.S.[3]

- Composition of matter patent for transmucosal delivery of cyclobenzaprine

Novel mechanism targets sleep quality

- Memory processing during sleep is important to recovery

[1] Threshold for entry CAPS-5 ≥ 33 in Phase 3 vs.29 in Phase 2; CAPS-5 = Clinician-Administered PTSD Scale for DSM-5; accepted primary endpoint for regulatory approval
[2] NDA = New Drug Application
[3] U.S. Patent No. 9,636,408 for eutectic proprietary Protectic™ formulation

Phase 3 HONOR Study Enrolling:
To confirm Phase 2 AtEase findings in military-related PTSD

General study characteristics:

Randomized, double-blind, placebo-controlled.
~550 participants in approximately 40 U.S. sites.

Tonmya once-daily at bedtime
5.6 mg *N ~ 275 (~140**)*

Placebo once-daily at bedtime
*N ~ 275 (~140**)*

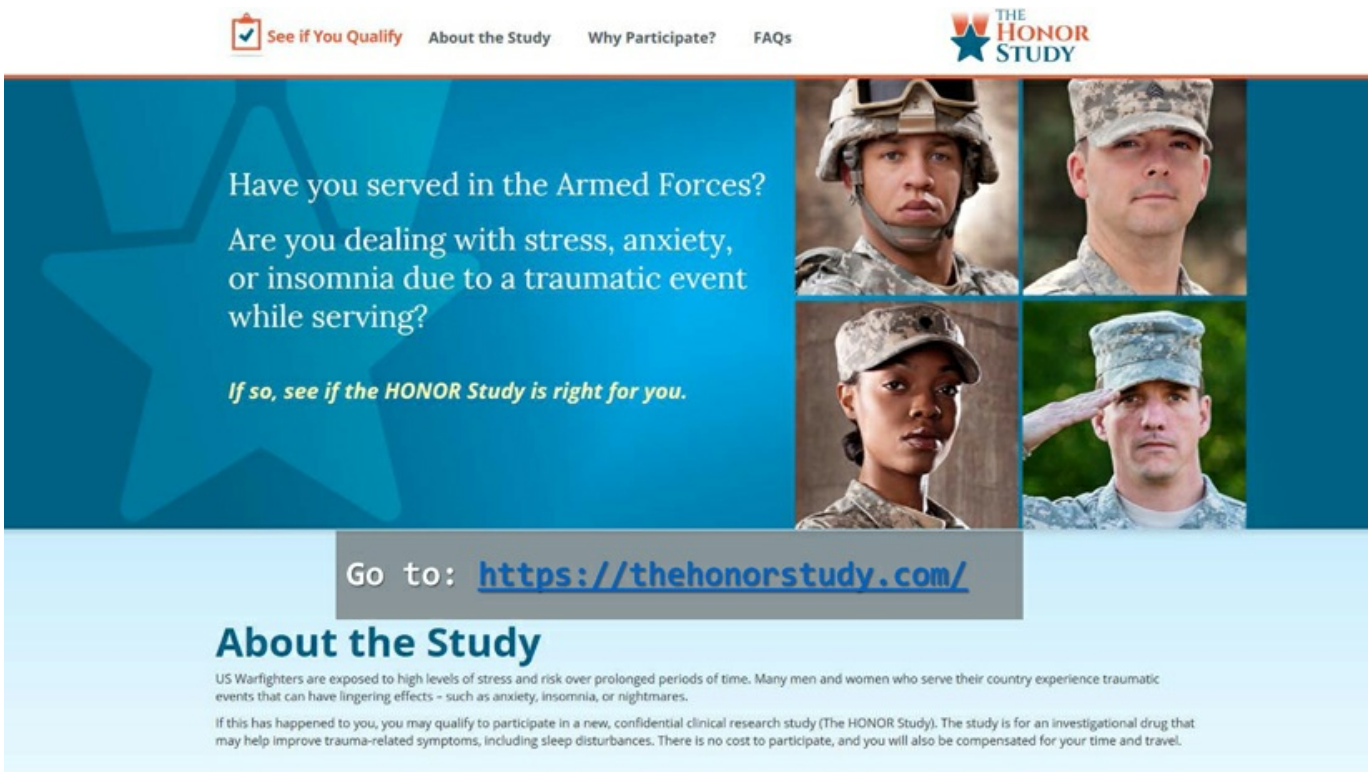
12 weeks → ····· *open-label extension*

Primary endpoint CAPS-5[1]:

- Mean change from baseline at week 12 (Tonmya 5.6 mg vs. placebo)
- Unblinded interim analysis will be reviewed by IDMC[2] to determine: (i) Early stop for efficacy (requires p-value < 0.01[3]), (ii) continuation as planned or (iii) sample size adjustment.
- Success for study with ~550 participants requires p-value < 0.045[3]

3Q 2018 – Interim Analysis outcome anticipated
1Q 2019 – topline data anticipated, if 550 participants are studied

[1]CAPS-5 = Clinician-Administered PTSD Scale for DSM-5
[2]IDMC=Independent data monitoring committee
[3]Pending final agreement with FDA on interim and complete Statistical Analysis Plans



See if You Qualify
About the Study
Why Participate?
FAQs
THE HONOR STUDY
Have you served in the Armed Forces?
Are you dealing with stress, anxiety, or insomnia due to a traumatic event while serving?
If so, see if the HONOR Study is right for you.
Go to: https://thehonorstudy.com/
About the Study
US Warfighters are exposed to high levels of stress and risk over prolonged periods of time. Many men and women who serve their country experience traumatic events that can have lingering effects – such as anxiety, insomnia, or nightmares.
If this has happened to you, you may qualify to participate in a new, confidential clinical research study (The HONOR Study). The study is for an investigational drug that may help improve trauma-related symptoms, including sleep disturbances. There is no cost to participate, and you will also be compensated for your time and travel.

Breakthrough Therapy Designation

FDA granted Tonmya Breakthrough Therapy designation – reported December 19, 2016

- PTSD is a serious condition
- Tonmya has potential advantages over existing therapies in military-related PTSD

Benefits of Breakthrough Therapy designation

- Eligibility for priority review of the NDA within 6 months instead of 10-12 months
- Option to submit completed portions of the NDA for rolling review
- An organizational commitment involving FDA's senior managers to accelerate the development and approval process, an opportunity to compress development time

NDA filing based on HONOR study is possible if results are statistically persuasive

- Discussed at March 9, 2017 Initial Cross-disciplinary Breakthrough Meeting with the FDA

Tonmya: Features in PTSD Therapy

Designed for bedtime use

- Every night, sublingual therapy

Targets sleep quality[1]

- The active ingredient cyclobenzaprine, interacts with receptors that regulate sleep quality: strongly binds and potently blocks 5-HT_{2A}, α_1-adrenergic and histamine H_1 receptors, permissive to sleep-dependent recovery processes

No recognized abuse potential

- Not a benzo or non-benzo class drug

U.S. patent protection through 2034

- Composition of matter and method of use patents issued – Pharmacokinetic patent application in review

[1] Daugherty et al., Abstract 728, Society of Biological Psychiatry 70th Annual Scientific Convention, May 14-16, 2015, Toronto Ontario, Canada

No Recognized Abuse Potential in Clinical Studies

Active ingredient is cyclobenzaprine, which is structurally related to tricyclic antidepressants

- Cyclobenzaprine interacts with receptors that regulate sleep quality: 5-HT_{2A}; α_1-adrenergic and histamine H_1 receptors
- Cyclobenzaprine does **NOT** interact with the same receptors as traditional hypnotic sleep drugs, benzodiazepines or non-benzodiazepines that are associated with retrograde amnesia
- Cyclobenzaprine-containing product was approved 40 years ago and current labeling (May 2016) indicates no abuse or dependence concern

Tonmya NDA can be filed without drug abuse and dependency assessment studies

- Discussed at March 9, 2017 Initial Cross-disciplinary Breakthrough Meeting with the FDA

TNX-102 SL Intellectual Property – U.S. Protection until 2034

Composition of matter (eutectic)

- U.S. Patent No. 9,636,408 issued in May 2017 by U.S. Patent and Trademark Office (USPTO)
  - Protection expected to 2034
- Japan Patent Office (JPO) issued Notice of Allowance in March 2018 for Patent Application 2016-503239
- Additional claims and jurisdictions pending

Pharmacokinetics (PK)

- JPO issued Japanese Patent No. 6259452 in December 2017
  - Protection expected to 2033
- Additional claims and jurisdictions pending

Method of use for active ingredient cyclobenzaprine

- European Patent Office issued European Patent No. 2,501,234 in September 2017
  - Protection expected to 2030
- USPTO issued Notice of Allowance in January 2018 for U.S. Patent Application 12/948,828
  - Expect patent to issue soon; protection expected to 2030
- Additional claims and jurisdictions pending

TNX-102 SL: Sublingual Formulation is Designed for Bedtime Administration

TNX-102 SL: Proprietary sublingual formulation of cyclobenzaprine (CBP) with transmucosal absorption

- Innovation by design with patent protected CBP/mannitol eutectic
- Rapid systemic exposure
- Increases bioavailability during sleep
- Avoids first-pass metabolism
- Lowers exposure to long-lived active major metabolite, norcyclobenzaprine (norCBP)

CBP undergoes extensive first-pass hepatic metabolism when orally ingested

- Active major metabolite, norCBP[1]
  - Long half-life (~72 hours)
  - Less selective for target receptors (5-HT_{2A}, α_1-adrenergic, histamine H_1)
  - More selective for norepinephrine transporter

[1] Daugherty et al., Abstract 728, Society of Biological Psychiatry 70th Annual Scientific Convention, May 14-16, 2015, Toronto Ontario, Canada

Tonmya: Novel Mechanism Targets Sleep Quality for Recovery from PTSD

PTSD is a disorder of recovery

- Most people exposed to extreme trauma recover over a few weeks
- In PTSD, recovery process impeded due to insufficient sleep-dependent memory processing

Memory processing is essential to recovery

- Vulnerability to memory intrusions and trauma triggers remains if no consolidation of new learning (extinction)

Tonmya targets sleep quality[1]

- The active ingredient in Tonmya, cyclobenzaprine, interacts with receptors that regulate sleep quality: strongly binds and potently blocks 5-HT_{2A}, α_1-adrenergic and histamine H_1 receptors, permissive to sleep-dependent recovery processes

[1] Daugherty et al., Abstract 728, Society of Biological Psychiatry 70th Annual Scientific Convention, May 14-16, 2015, Toronto Ontario, Canada

What are the Consequences of PTSD?

Consequences:

- Impaired daily function and substantial interference with work and social interactions
- Reckless or destructive behavior
- Increased health care utilization and greater medical morbidity

PTSD as a risk factor for:

- Depression
- Alcohol or substance abuse
- Absenteeism/unemployment
- Homelessness
- Violent acts
- Suicidal thoughts and suicide

What are the Symptoms of PTSD?

Symptoms of PTSD fall into four clusters:

1. Intrusion (aversive memories, nightmares, flashbacks)
2. Avoidance (avoiding persons, places or situations)
3. Mood/cognitions (memory block, emotional numbing, detachment from others)
4. Hyperarousal (anxiety, agitation & sleep disturbance)

CAPS-5 is used to assess symptom severity and treatment effect

- Recognized as the standard for rating PTSD severity in clinical trials
- Takes into account all four symptom clusters
- Global regulatory approval standard (approval of sertraline and paroxetine were based on CAPS score)

PTSD: Not Well-Served by Approved Treatments

FDA-approved SSRIs, paroxetine and sertraline, have not shown efficacy in military-related PTSD

Majority of patients unresponsive or intolerant to current treatments

- Side effects relating to sexual dysfunction (particularly in males) and sleep are commonly reported

Characteristics of an ideal drug therapy that would be compatible and complementary with behavioral therapy

- Lack of retrograde amnesia (e.g., unlike off-label use of benzodiazepines and non-benzodiazepines)
- Lack of interference on sleep (e.g., unlike approved SSRIs)

High Prevalence of PTSD Among Combat Veterans

3-9%
General population[1]

19-31%
Vietnam veterans[2]

>19%
Operation Enduring Freedom (OEF; Afghanistan) / Operation Iraqi Freedom (OIF) veterans / Operation New Dawn (OND)[3]

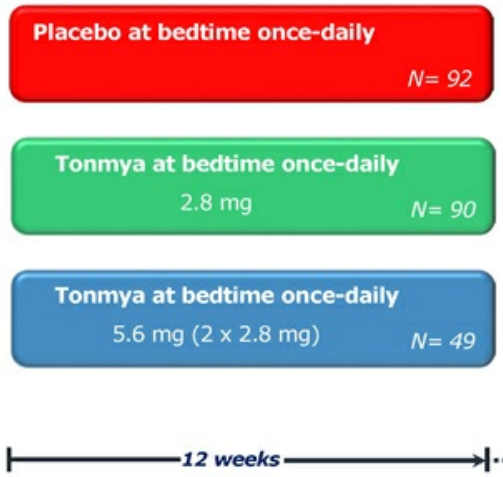
8.6 million American adults affected[1]

Women more likely to develop than men[1]

Susceptibility may **run in families**[1]

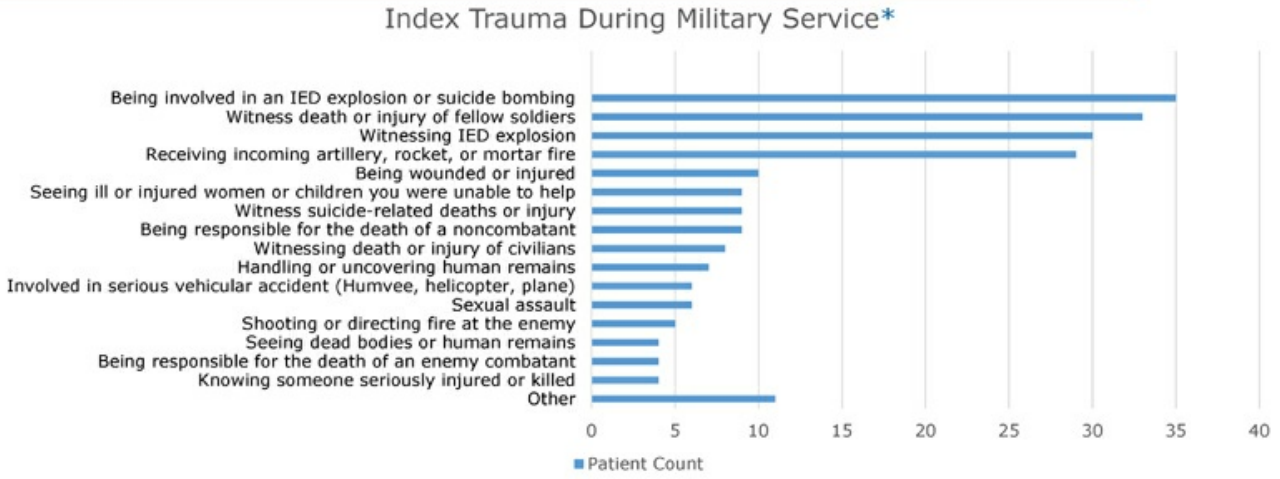
[1] Kessler et al., *Arch Gen Psych* 2005; Prevalence rate of 3.5% applied to U.S. Census estimate of 247M U.S. adult (≥18) population in 2015 (www.census.gov/quickfacts/table/PST045215/00); [2]Norris, *PTSD Res Quar*. 2013; [3]*Analysis of VA Health Care Utilization among Operation Enduring Freedom, Operation Iraqi Freedom, and Operation New Dawn Veterans, from 1st Qtr FY 2002 through 2nd Qtr FY 2015,* Washington, DC; Among 1.9M separated OEF/OIF/OND veterans, 1.2M have obtained VA healthcare; 685k evaluated by VA with possible mental disorder, and 379k diagnosed with PTSD.

Phase 2 AtEase Study in Military-Related PTSD



- Randomized, double-blind, placebo-controlled trial in military-related PTSD
- Efficacy analysis from 231 patients; 24 U.S. clinical sites
- Enrolled patients with baseline CAPS-5 ≥ 29
- Primary Efficacy Analysis:
  - Difference in CAPS-5 score change from baseline between Tonmya 2.8 mg and placebo at week 12
- Key Secondary Measures:
  - PROMIS Sleep Disturbance, CGI-I, SDS

AtEase Study: Traumas Associated with PTSD



*Some patients experienced more than one trauma

AtEase Study – Summary of Primary and Secondary Analyses (week 12)

Assessment	Domain	Analysis	p-Values	
			2.8 mg (N=90)	5.6 mg (N=49)
CAPS-5	Total	MMRM (Primary Analysis)	0.259^	0.053
	Total	MMRM with Multiple Imputation	0.211	0.031*
	Total	MMRM w/ Hybrid LOCF/BOCF	0.172	0.037*
	Total	ANCOVA	0.090	0.038*

PGIC	Mean score	MMRM	0.075	0.035*
Sheehan Disability Scale	Work/school item	MMRM	0.123	0.050*
	Social/leisure item	MMRM	0.198	0.031*

BOCF, baseline observation carried forward; CGI-I, Clinical Global Impression - Improvement scale; LOCF, last observation carried forward; MMRM, mixed model repeated measures; PGIC, Patient Global Impression of Change
^Primary analysis p-value not significant comparing Tonmya 2.8 mg versus placebo
*p<0.05

AtEase Study: Safety and Tolerability Profile

No serious adverse events reported with Tonmya deemed related to treatment

Systemic Adverse Events*	Placebo (N=94)	Tonmya 2.8 mg (N=93)	Tonmya 5.6 mg (N=50)
Somnolence	6.4%	11.8%	16.0%
Dry Mouth	10.6%	4.3%	16.0%
Headache	4.3%	5.4%	12.0%
Insomnia	8.5%	7.5%	6.0%
Sedation	1.1%	2.2%	12.0%
Administration Site Reactions*			
Hypoaesthesia oral	2.1%	38.7%	36.0%
Paraesthesia	3.2%	16.1%	4.0%
Glossodynia	1.1%	3.2%	6.0%

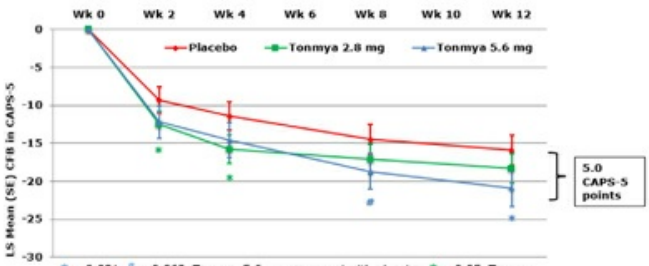
Trial completion rates: 73% placebo; 79% Tonmya 2.8 mg; 84% Tonmya 5.6 mg

*at rates of >5% in either drug-treated arm, Safety population N=237

AtEase
Total CAPS-5 for Intention-to-Treat Population and Retrospective Analysis for Subgroup with Entry CAPS-5 ≥33

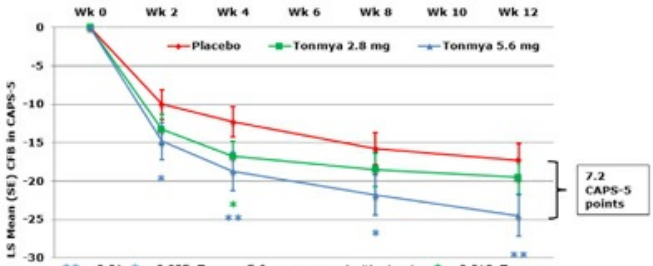
CAPS-5 LS Total Score Mean Change from Baseline (CFB)

Intention-to-Treat Population



*p=0.031, #p=0.063, Tonmya 5.6 mg compared with placebo; *p<0.05, Tonmya 2.8 mg compared with placebo; analysis is mixed-effect model repeated measures (MMRM) with multiple imputation (MI); CAPS-5, Clinician-Administered PTSD Scale for DSM-5; LS, least squares; SE, standard error.

Subgroup with entry CAPS-5 ≥33



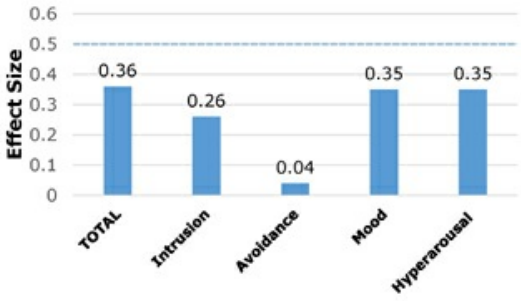
**p<0.01, *p<0.025, Tonmya 5.6 mg compared with placebo; *p=0.018, Tonmya 2.8 mg compared with placebo; analysis is MMRM with MI; LS, least squares; SE, standard error.

A baseline CAPS-5 score ≥33 was set as the PTSD severity inclusion criterion in Phase 3 HONOR study

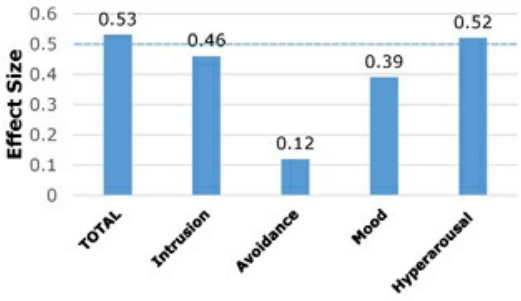
AtEase

Effect Sizes for Total CAPS-5 and Symptom Clusters for Intention-to-Treat Population and Subgroup with Entry CAPS-5 ≥33

Effect Sizes of Tonmya 5.6 mg in AtEase Intention-to-Treat Sample



Effect Sizes in Tonmya 5.6 mg in AtEase Subgroup with Entry CAPS-5 ≥33



- Note larger effect sizes, in moderate range of 0.5, for total CAPS-5 and intrusion and hyperarousal clusters in subgroup

A baseline CAPS-5 score ≥33 was set as the PTSD severity inclusion criterion in Phase 3 HONOR study

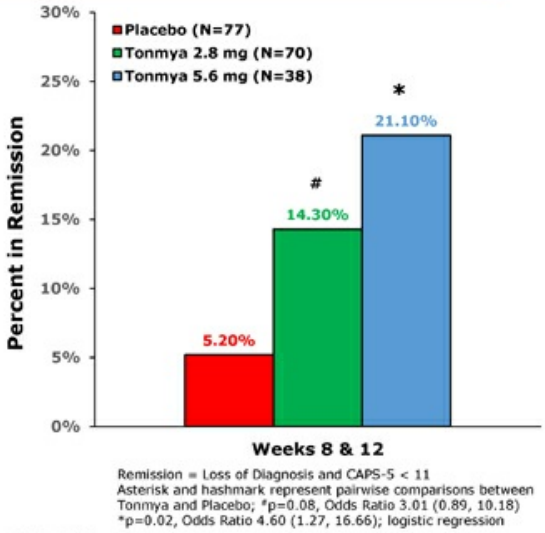
AtEase Study Retrospective Analysis:
Remission in Subgroup with Entry CAPS-5 ≥33

Remission is a clinical state that is essentially asymptomatic

In order to confirm remission:

- Determined rates of participants who met remission status at *both* Week 8 and Week 12

21% of the Tonmya 5.6 mg participants had confirmed remission v. 5% of placebo (p=0.02)



Remission = Loss of Diagnosis and CAPS-5 < 11
Asterisk and hashmark represent pairwise comparisons between Tonmya and Placebo; #p=0.08, Odds Ratio 3.01 (0.89, 10.18)
*p=0.02, Odds Ratio 4.60 (1.27, 16.66); logistic regression

TNX-102 SL – Multiple Potential Indications

Management of Fibromyalgia (FM) – chronic pain condition

- TNX-102 SL clinical development in FM was halted after near miss in Phase 3 at low dose (2.8 mg) – half the dose being developed for PTSD
- Imbalance in "withdrawal of consent" led to statistical miss on responder analysis – a few TNX-102 SL treated patients "moved out of state"
- Average pain improvement (secondary endpoint) after 12 weeks of treatment showed statistical significance ($P < 0.05$)
- Low dose TNX-102 SL (2.8 mg) showed an improvement in sleep quality in Phase 2 and Phase 3 FM trials

Agitation in Alzheimer's Disease

- Phase 2 IND submitted March 2018
- Phase 2 study can be a pivotal efficacy study

Consequences of Agitation in Alzheimer's Disease

Outcomes

- Agitation is associated with significant poor outcomes for Alzheimer's patients and challenges for their caregivers

Common reason for institutionalization

- Development of agitation, or its worsening, is one of the most common reasons for patients having to transition from lower- to higher levels of care (nursing homes and other long-term care settings)[1]

Cost

- The presence of agitation nearly doubles the cost of caring for patients with Alzheimer's disease, and agitation is estimated to account for more than 12% of the healthcare and societal cost of Alzheimer's disease, which is currently estimated to be $256 Billion for the year 2017 in the United States[1]

[1]The Alzheimer's Association, 2017 Alzheimer's Disease Facts and Figures: https://www.alz.org/facts/

Agitation in Alzheimer's Disease – Potential New Indication for TNX-102 SL

Successful pre-IND meeting in November, 2017

- Phase 2 IND submitted March 2018

Significant unmet need

- No FDA approved drugs for the treatment of agitation in Alzheimer's

Mechanism of improving sleep quality

- Sleep disturbance is a significant and common symptoms in Alzheimer's

Pharmacological advantages outweigh potential concerns of using TNX-102 SL in treating agitation in Alzheimer's disease

- Blocks 3 receptors, not just one (e.g., 5-HT_{2A})
- Anti-muscarinic (M1) effect in patients on anticholinergics (e.g., donepezil and rivastigmine) possibly reduced with lower sublingual dose

Scientific Rationale for Developing TNX-102 SL for Agitation in Alzheimer's Disease

Connection between Sleep Disturbance and Agitation

- Agitation in Alzheimer's Disease is associated with sleep disturbance[1,2]
- Evidence that improving sleep could improve agitation[3]

Supported by Potential Mechanism of Action

- TNX-102 is a multifunctional agent including antagonism of 5-HT_{2A}, α_1-adrenergic and histamine H_1 receptors
- Certain 5-HT_{2A} antagonists have shown clinical efficacy against agitation in dementia including trazodone[4,5], and mirtazapine[6]
- The α_1-adrenergic antagonist prazosin has shown efficacy in the treatment of agitation in dementia[7]
- The histamine H_1 antagonist hydroxyzine had historical use in treating agitation in dementia[8]

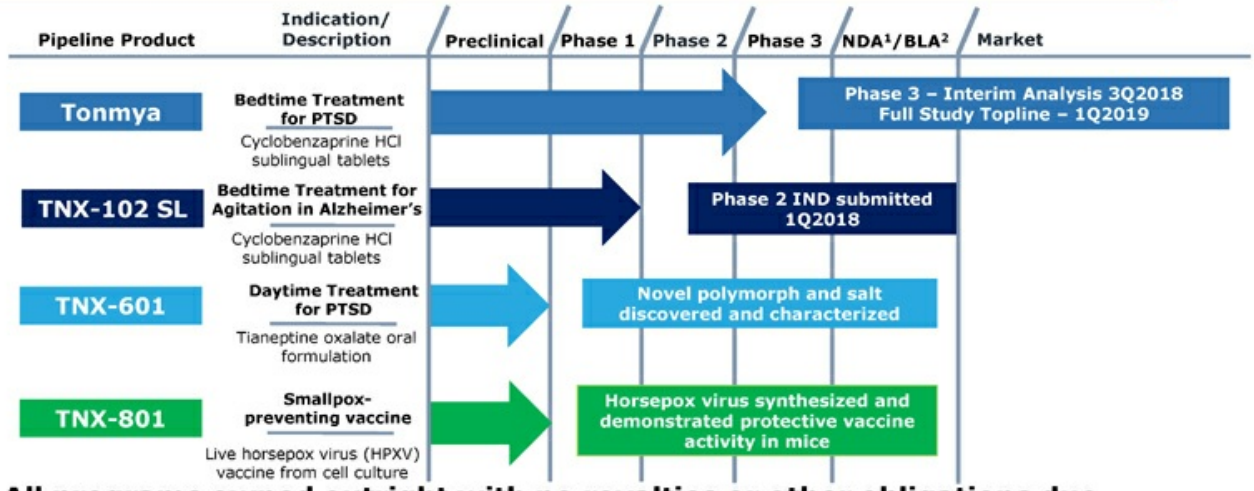
Candidates in Development



All programs owned outright with no royalties or other obligations due

[1]NDA- New Drug Application; [2]BLA –Biologic Licensing Application; [3]Investigational New Drug Application

TNX-601 (Tianeptine Oxalate): A Potential Clinical Candidate for PTSD

Pre-IND Candidate

Targeting a Condition with Significant Unmet Need

Targeted as a 1st line monotherapy for PTSD: oral formulation for daytime dosing

- ✓ **Leverages expertise in PTSD (clinical and regulatory experience, market analysis, etc.)**
- ✓ **Mechanism of Action (MOA) is different from Tonmya**

- Tianeptine sodium (amorphous) has been approved in EU, Russia, Asia and Latin America for depression since 1987 with established post-marketing experience
- Identified new oxalate salt polymorph with improved pharmaceutical properties ideal for reformulation

Filed patent application on novel salt polymorph

- Issued patent on steroid-induced cognitive impairment and memory loss issues

Clinical evidence for PTSD

- Several studies have shown tianeptine to be active in the treatment of PTSD[1-4]

[3] Aleksandrovskiĭ IA, et al. Zh Nevrol Psikhiatr Im S S Korsakova. 2005;105(11):24-9. PMID: 16329631 [Russian]
[4] Onder E, et al. Eur Psychiatry. 2006 (3):174-9. PMID: 15964747

TNX-801 (Synthesized Live Horsepox Virus): A Smallpox-Preventing Vaccine Candidate

Pre-IND Stage

Potential improvement over current biodefense tools against smallpox

- ✓ Leverages Tonix's government affairs effort
- ✓ Collaboration with Professor David Evans and Dr. Ryan Noyce at University of Alberta
- ✓ Demonstrated protective vaccine activity in mice
- ✓ Patent application on novel vaccine submitted

Regulatory strategy

- We intend to meet with FDA to discuss the most efficient and appropriate investigational plan to support the licensure, either:
  - ✓ Application of the "Animal Rule", or
  - ✓ Conducting an active comparator study using ACAM2000
- Good Manufacturing Practice (GMP) viral production process in development

Targeting a Potential Public Health Issue

Material threat medical countermeasure under 21st Century Cures Act

- Qualifies for **Priority Review Voucher* (PRV)** upon licensure
  - ✓ **PRVs have no expiration date, are transferrable and have sold for ~$125 M**

[1]PRV can be applied to any BLA/NDA for priority 6-month review

TNX-801 (Synthesized Live Horsepox Virus): A Smallpox-Preventing Vaccine Candidate

Synthesis[1] from sequence of a 1976 Mongolian isolate[2]

In mice, TNX-801 behaved like attenuated vaccinia virus

- Vaccinia is the term used to classify the live poxviruses that are used as smallpox vaccines, including ACAM2000, which is the latest smallpox vaccine licensed in the U.S.

How is HPXV related to modern vaccines?

- Multiple sources[3-5] indicate that the smallpox vaccine discovered by Dr. Edward Jenner in the early 19th century was either HPXV or a very similar virus and that vaccinia vaccines are derived from this ancestral strain
- A 1902 U.S. smallpox vaccine was found to be highly similar (99.7% similarity in core genome[6]) to HPXV sequence from the 1976 Mongolian isolate
- Horsepox is now believed to be extinct[5]

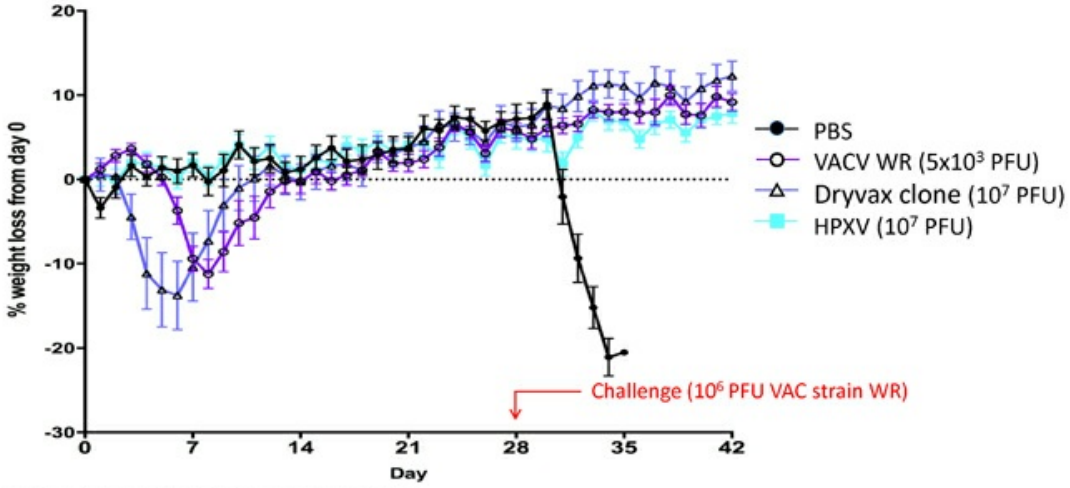
Biological Properties of HPXV: Less Virulent than a Dryvax Clone, but Produces Protective Immunity



Noyce, RS, Lederman S, Evans DH. PLoS ONE. 2018; 13(1): e0188453
https://doi.org/10.1371/journal.pone.0188453

Current Needs to Vaccinate Against Smallpox

Ongoing vaccination of U.S. troops

- Troops in the Global Response Force

Threat of smallpox re-introduction

- Strategic National Stockpile & public health policy

Re-emergence of monkey pox[1]

- Believed to resurgent because of vaccinia-naïve populations in Africa
- Multiple U.S. military operations ongoing in Africa

[1]Nda- Isaiah, J. Nigeria: Monkey Pox Scourge Spreads to Seven States. All Africa. 12 OCTOBER 2017, HTTP://ALLAFRICA.COM/STORIES/201710120177.HTML

Potential for Use of HPXV as a Vector for Vaccines to Infectious Disease or Cancer

Poxviruses like HPXV can be engineered to express foreign genes and are well recognized platforms for vaccine development

- Large packaging capacity for exogenous DNA inserts (i.e. encoding antigens)
- Precise virus-specific control of exogenous gene insert expression
- Lack of persistence or genomic integration in the host
- Strong immunogenicity as a vaccine
- Ability to rapidly generate vector/insert constructs
- Readily manufacture at scale
- Live, replicating vaccine – direct antigen presentation

Potential advantages of HPXV- strong immunogenicity with good tolerability

Milestones – Recently Completed and Upcoming

Tonmya – Posttraumatic Stress Disorder

☑	May 2016	Reported results from Phase 2 AtEase study
☑	August 2016	End-of-Phase 2 meeting with FDA - Proposed Phase 3 clinical and NDA plan accepted
☑	December 2016	Breakthrough Therapy designation granted by FDA
☑	January 2017	FDA concurrence with Phase 3 HONOR study design in military-related PTSD
☑	1Q 2017	Initial Cross-disciplinary Breakthrough Meeting with FDA
☑	1Q 2017	Commenced enrollment of HONOR study
☑	2Q 2017	U.S. Patent No. 9,636,408 issued for eutectic formulation of Tonmya
☑	3Q 2017	European Patent No. 2,501,234 issued for TNX-102 method of use
☑	4Q 2017	Japan patent No. 6259452 issued for TNX-102 SL pharmacokinetics
☑	1Q 2018	Notice of Allowance for U.S. Patent Application 12/948,828 TNX-102 method of use
☑	2Q 2018	Randomization of 50% of HONOR study participants
☐	3Q 2018	Anticipated interim analysis of HONOR study in ~275 randomized participants
☐	1Q 2019	Anticipated topline results of HONOR study in ~550 randomized participants (if needed)

Summary

Near term milestones in Phase 3 program PTSD focused on military-related PTSD

- Major unmet need; 8.6 Million Americans affected
- Potential for NDA approval based on one study

New indication for agitation in Alzheimer's Disease

- Phase 2 IND submitted 1Q 2018

New day-time PTSD therapy in development

- Leverages development expertise in PTSD, i.e., trial recruitment and execution

New vaccine in development to prevent Smallpox

- Opportunity to supply stockpiling requirement; short development path
- Studies in mice suggest improved safety profile

Version P0111 4-13-18 (Doc 0341)

Cautionary Note on Forward-Looking Statements

Certain statements in this presentation regarding strategic plans, expectations and objectives for future operations or results are "forward-looking statements" as defined by the Private Securities Litigation Reform Act of 1995. These statements may be identified by the use of forward-looking words such as "anticipate," "believe," "forecast," "estimate" and "intend," among others. These forward-looking statements are based on Tonix's current expectations and actual results could differ materially. There are a number of factors that could cause actual events to differ materially from those indicated by such forward-looking statements. These factors include, but are not limited to, substantial competition; our need for additional financing; uncertainties of patent protection and litigation; uncertainties of government or third party payor reimbursement; limited research and development efforts and dependence upon third parties; and risks related to failure to obtain U.S. Food and Drug Administration clearances or approvals and noncompliance with its regulations. As with any pharmaceutical under development, there are significant risks in the development, regulatory approval and commercialization of new products. The forward-looking statements in this presentation are made as of the date of this presentation, even if subsequently made available by Tonix on its website or otherwise. Tonix does not undertake an obligation to update or revise any forward-looking statement, except as required by law. Investors should read the risk factors set forth in the Annual Report on Form 10-K for the year ended December 31, 2017, as filed with the Securities and Exchange Commission (the "SEC") on March 9, 2018, and periodic reports filed with the SEC on or after the date thereof. All of Tonix's forward-looking statements are expressly qualified by all such risk factors and other cautionary statements.

Tonix Development Highlights

Cyclobenzaprine Sublingual Tablets

Lead Program Tonmya®[1] - FDA Breakthrough Therapy in PTSD[2]
- Phase 3 HONOR study enrolling- bedtime treatment for PTSD

TNX-102 SL[3] - Bedtime treatment for agitation in Alzheimer's disease
- Phase 2 IND submitted in March 2018

Pipeline

TNX-601[4] - Pre-IND candidate for daytime treatment for PTSD
- Nonclinical development ongoing

TNX-801[5] - Smallpox-preventing vaccine candidate
- Efficacy demonstrated in mice model
- cGMP process development underway

[1] Tonmya has been conditionally accepted by the U.S. FDA as the proposed trade name for TNX-102 SL (cyclobenzaprine HCl sublingual tablets) for PTSD. Tonmya is an investigational new drug and has not been approved for any indication.
[2] PTSD = Posttraumatic stress disorder
[3] TNX-102 SL is an investigational new drug and has not been approved for any indication.
[4] Tianeptine oxalate
[5] Synthesized live horsepox virus

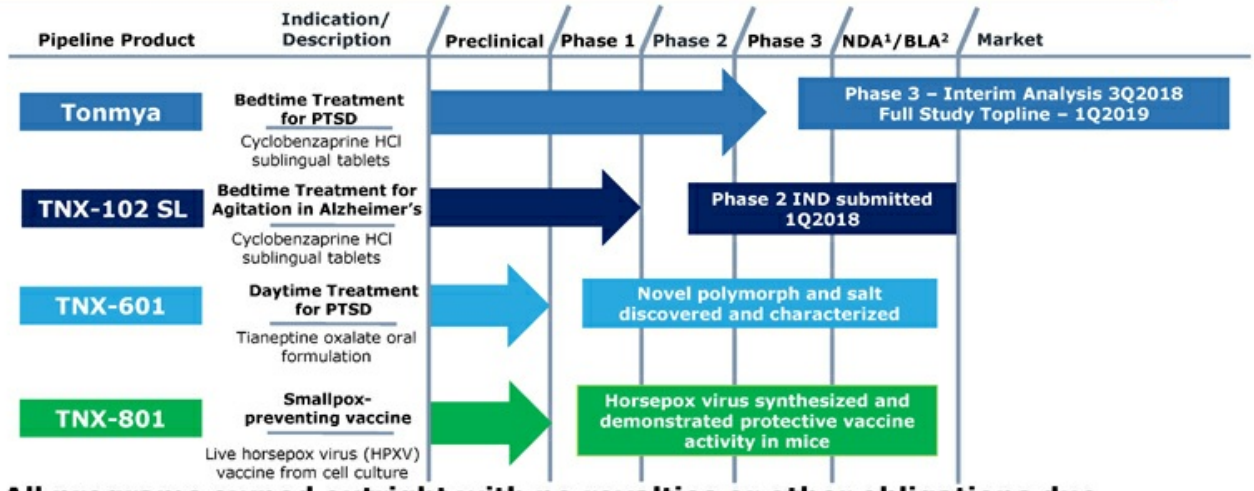
Candidates in Development



All programs owned outright with no royalties or other obligations due

[1]NDA- New Drug Application; [2]BLA –Biologic Licensing Application; [3]Investigational New Drug Application

Tonmya for PTSD

Phase 3 HONOR study in military-related PTSD enrolling

- Encouraging evidence of safety and efficacy was demonstrated in Phase 2
- Higher entry CAPS-5 criterion used in Phase 3[1]

Breakthrough Therapy designation from the FDA

- Expedited development and accelerated approval are expected

Proposed registration plan agreed to by the FDA

- Potential NDA[2] approval based on one Phase 3 study

Patent protection through 2034 in U.S.[3]

- Composition of matter patent for transmucosal delivery of cyclobenzaprine

Novel mechanism targets sleep quality

- Memory processing during sleep is important to recovery

[1] Threshold for entry CAPS-5 ≥ 33 in Phase 3 vs.29 in Phase 2; CAPS-5 = Clinician-Administered PTSD Scale for DSM-5; accepted primary endpoint for regulatory approval
[2] NDA = New Drug Application
[3] U.S. Patent No. 9,636,408 for eutectic proprietary Protectic™ formulation

Phase 3 HONOR Study Enrolling

To confirm Phase 2 AtEase findings in military-related PTSD

Tonmya once-daily at bedtime
5.6 mg *N ~ 275 (~140**)*

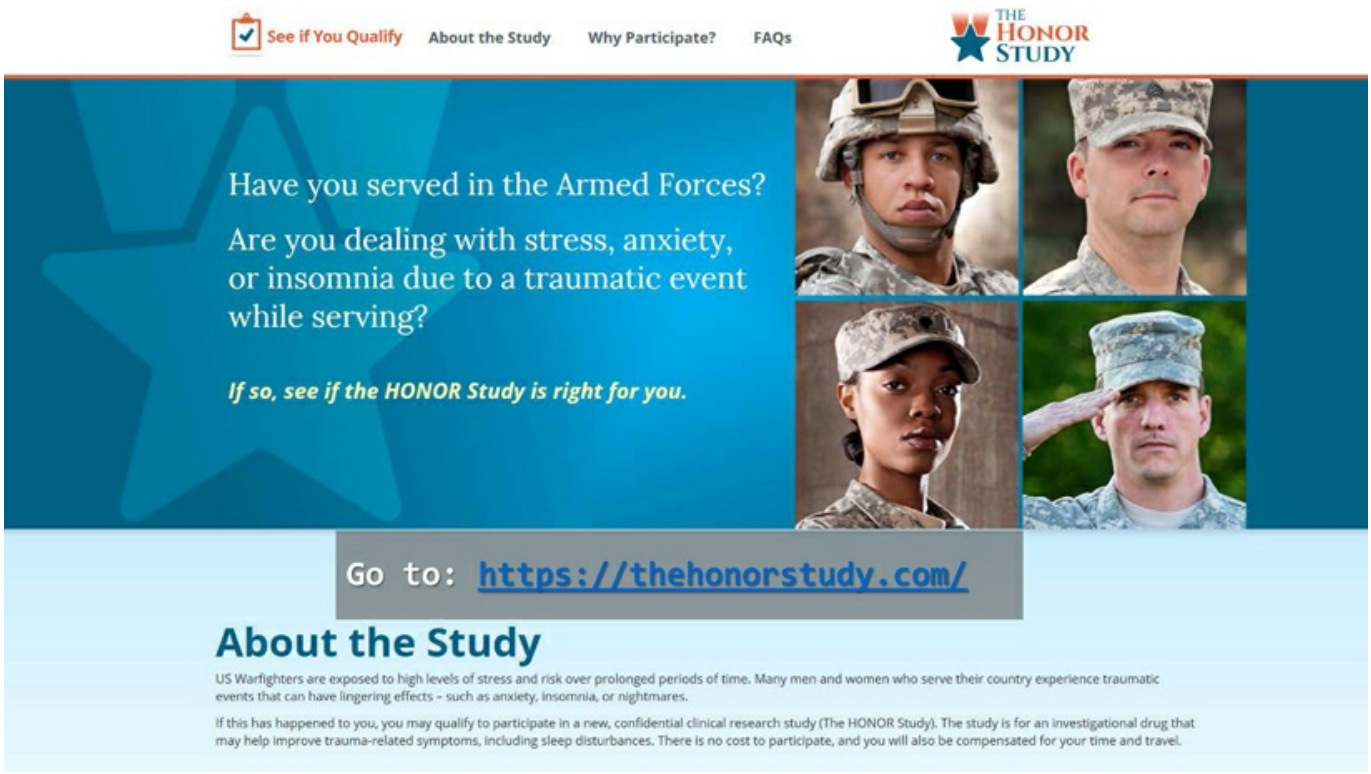
Placebo once-daily at bedtime
*N ~ 275 (~140**)*

12 weeks ····· *open-label extension*

- **General study characteristics:**
- Randomized, double-blind, placebo-controlled.
- ~550 participants in approximately 40 U.S. sites.
- Unblinded interim analysis will be reviewed by IDMC* to determine: (i) Early stop for efficacy, (ii) continuation as planned or (iii) sample size adjustment.
- **Primary endpoint CAPS-5**:**
- Mean change from baseline at week 12 (Tonmya 5.6 mg vs. placebo)

3Q 2018 – Interim Analysis outcome anticipated
1Q 2019 – topline data anticipated, if 550 participants are studied

**IDMC=Independent data monitoring committee*
**CAPS-5 = Clinician-Administered PTSD Scale for DSM-5



See if You Qualify
About the Study
Why Participate?
FAQs
THE HONOR STUDY
Have you served in the Armed Forces?
Are you dealing with stress, anxiety, or insomnia due to a traumatic event while serving?
If so, see if the HONOR Study is right for you.
Go to: https://thehonorstudy.com/
About the Study
US Warfighters are exposed to high levels of stress and risk over prolonged periods of time. Many men and women who serve their country experience traumatic events that can have lingering effects – such as anxiety, insomnia, or nightmares.
If this has happened to you, you may qualify to participate in a new, confidential clinical research study (The HONOR Study). The study is for an investigational drug that may help improve trauma-related symptoms, including sleep disturbances. There is no cost to participate, and you will also be compensated for your time and travel.

Breakthrough Therapy Designation

Granted to Tonmya by FDA December 19, 2016

- PTSD is a serious condition
- Tonmya has potential advantages over existing therapies in military-related PTSD

Benefits of Breakthrough Therapy designation

- Eligibility for priority review
- Option for rolling NDA review
- FDA committed to accelerate the development and approval process

NDA approval can be based on one Phase 3 study

Tonmya: Features in PTSD Therapy

Designed for bedtime use

- Every night, sublingual therapy

Targets sleep quality[1]

- The active ingredient cyclobenzaprine, interacts with receptors that regulate sleep quality: strongly binds and potently blocks 5-HT_{2A}, α_1-adrenergic and histamine H_1 receptors, permissive to sleep-dependent recovery processes

No recognized abuse potential

- Not a benzo or non-benzo class drug

U.S. patent protection through 2034

- Composition of matter and method of use patents issued – Pharmacokinetic patent application in review

[1] Daugherty et al., Abstract 728, Society of Biological Psychiatry 70th Annual Scientific Convention, May 14-16, 2015, Toronto Ontario, Canada

PTSD Characteristics

Symptoms of PTSD fall into four clusters:

1. Intrusion
2. Avoidance
3. Mood/cognitions
4. Hyperarousal

Consequences:

- Impaired daily function and substantial interference with work and social interactions
- Reckless or destructive behavior
- Increased health care utilization and greater medical morbidity

PTSD is a risk factor for:

- Depression
- Alcohol or substance abuse
- Absenteeism/unemployment
- Homelessness
- Violent acts
- Suicidal thoughts and suicide

PTSD: Not Well-Served by Approved Treatments

Majority of patients unresponsive or intolerant to current treatments

- FDA-approved SSRIs have not shown efficacy in military-related PTSD
- Side effects relating to sexual dysfunction (particularly in males) and sleep are commonly reported

The ideal drug therapy should be complementary with behavioral therapy

- Lack of retrograde amnesia (e.g., unlike off-label use of benzodiazepines and non-benzodiazepines)
- Lack of interference on sleep (e.g., unlike approved SSRIs)

High Prevalence of PTSD Among Combat Veterans

3-9%
General population[1]

19-31%
Vietnam veterans[2]

>19%
Operation Enduring Freedom (OEF; Afghanistan) / Operation Iraqi Freedom (OIF) veterans / Operation New Dawn (OND)[3]

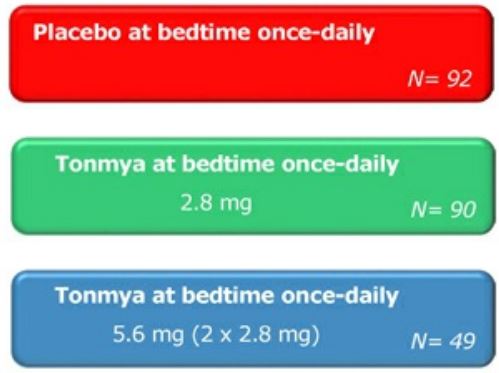
8.6 million American adults affected[1]

Women more likely to develop than men[1]

Susceptibility may **run in families**[1]

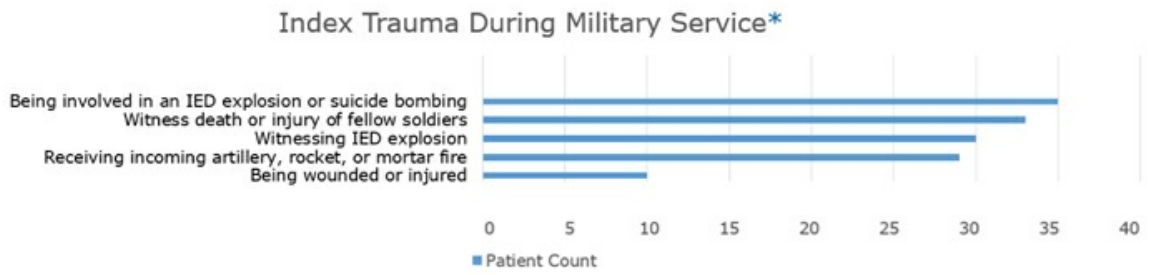
[1] Kessler et al., *Arch Gen Psych* 2005; Prevalence rate of 3.5% applied to U.S. Census estimate of 247M U.S. adult (≥18) population in 2015 (www.census.gov/quickfacts/table/PST045215/00); [2]Norris, *PTSD Res Quar*. 2013; [3]*Analysis of VA Health Care Utilization among Operation Enduring Freedom, Operation Iraqi Freedom, and Operation New Dawn Veterans, from 1st Qtr FY 2002 through 2nd Qtr FY 2015,* Washington, DC; Among 1.9M separated OEF/OIF/OND veterans, 1.2M have obtained VA healthcare; 685k evaluated by VA with possible mental disorder, and 379k diagnosed with PTSD.

Phase 2 AtEase Study in Military-Related PTSD



- Randomized, double-blind, placebo-controlled trial
- Efficacy analysis from 231 patients in 24 U.S. sites
- Entry CAPS-5 ≥ 29
- Primary Analysis:
  - Difference in CAPS-5 score change from baseline at week 12 (Tonmya 2.8 mg vs. placebo)
- Key Secondary Measures:
  - PROMIS Sleep Disturbance, CGI-I, SDS

AtEase Study: Top 5 Traumas Associated with PTSD



**Some patients experienced more than one trauma*
IED = Improvised explosive device

AtEase Study –Primary Endpoint
CAPS-5 Change From Baseline at Week 12
Statistical Analysis Based on Missing Data Handling

Assessment	Domain	Analysis	p-Values	
			2.8 mg (N=90)	5.6 mg (N=49)
CAPS-5	Total	MMRM (Primary Analysis)	0.259^	0.053
	Total	MMRM with Multiple Imputation	0.211	0.031*
	Total	MMRM w/ Hybrid LOCF/BOCF	0.172	0.037*
	Total	ANCOVA	0.090	0.038*

BOCF, baseline observation carried forward; CGI-I, Clinical Global Impression - Improvement scale; LOCF, last observation carried forward; MMRM, mixed model repeated measures; PGIC, Patient Global Impression of Change
^Primary analysis p-value not significant comparing Tonmya 2.8 mg versus placebo
*p<0.05

AtEase Study: Safety and Tolerability Profile

No serious adverse events reported with Tonmya deemed related to treatment

Systemic Adverse Events*	Placebo (N=94)	Tonmya 2.8 mg (N=93)	Tonmya 5.6 mg (N=50)
Somnolence	6.4%	11.8%	16.0%
Dry Mouth	10.6%	4.3%	16.0%
Headache	4.3%	5.4%	12.0%
Insomnia	8.5%	7.5%	6.0%
Sedation	1.1%	2.2%	12.0%
Administration Site Reactions*			
Hypoaesthesia oral	2.1%	38.7%	36.0%
Paraesthesia	3.2%	16.1%	4.0%
Glossodynia	1.1%	3.2%	6.0%

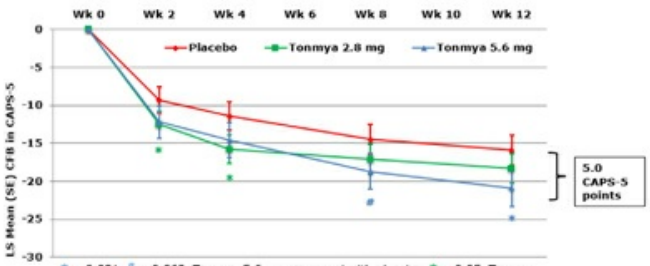
Trial completion rates: 73% placebo; 79% Tonmya 2.8 mg; 84% Tonmya 5.6 mg

*at rates of >5% in either drug-treated arm, Safety population N=237

AtEase Study:
Total CAPS-5 for Intention-to-Treat Population and Retrospective Analysis for Subgroup with Entry CAPS-5 ≥33

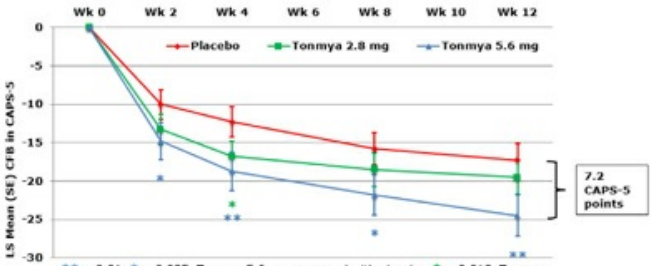
CAPS-5 LS Total Score Mean Change from Baseline (CFB)

Intention-to-Treat Population



*p=0.031, #p=0.063, Tonmya 5.6 mg compared with placebo; *p<0.05, Tonmya 2.8 mg compared with placebo; analysis is mixed-effect model repeated measures (MMRM) with multiple imputation (MI); CAPS-5, Clinician-Administered PTSD Scale for DSM-5; LS, least squares; SE, standard error.

Subgroup with entry CAPS-5 ≥33

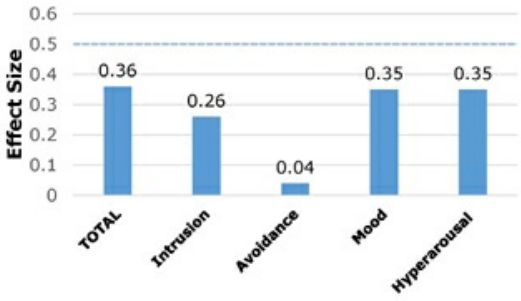


**p<0.01, *p<0.025, Tonmya 5.6 mg compared with placebo; *p=0.018, Tonmya 2.8 mg compared with placebo; analysis is MMRM with MI; LS, least squares; SE, standard error.

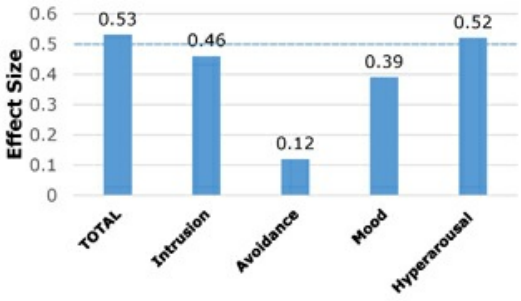
A baseline CAPS-5 score ≥33 was set as entry criterion in Phase 3 HONOR study

AtEase Study:
Effect Sizes for Total CAPS-5 and Symptom Clusters for Intention-to-Treat Population and Subgroup with Entry CAPS-5 ≥33

Effect Sizes of Tonmya 5.6 mg in AtEase Intention-to-Treat Sample



Effect Sizes in Tonmya 5.6 mg in AtEase Subgroup with Entry CAPS-5 ≥33



- Note larger effect sizes, in moderate range of 0.5, for total CAPS-5 and intrusion and hyperarousal clusters in subgroup

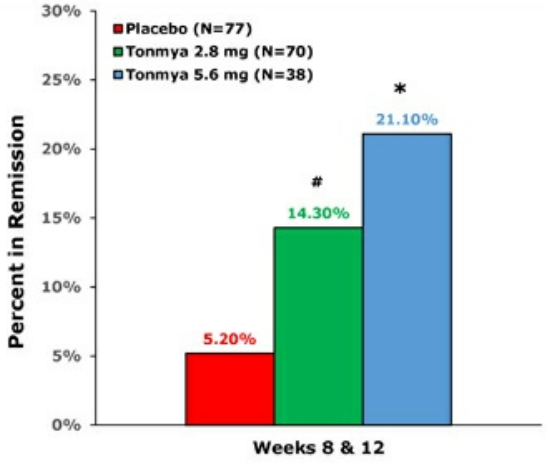
A baseline CAPS-5 score ≥33 was set as entry criterion in Phase 3 HONOR study

AtEase Study Retrospective Analysis:
Remission in Subgroup with Entry CAPS-5 ≥33

Remission is a clinical state that is essentially asymptomatic

In order to confirm remission:

- Determined rates of participants who met remission status at *both* Week 8 and Week 12



Remission = Loss of Diagnosis and CAPS-5 < 11
Asterisk and hashmark represent pairwise comparisons between Tonmya and Placebo; #p=0.08, Odds Ratio 3.01 (0.89, 10.18)
*p=0.02, Odds Ratio 4.60 (1.27, 16.66); logistic regression

21% of the Tonmya 5.6 mg participants had confirmed remission v. 5% of placebo (p=0.02)

TNX-102 SL – Multiple Potential Indications

Management of Fibromyalgia (FM) – chronic pain condition

- TNX-102 SL clinical development in FM was halted after near miss in Phase 3 at low dose (2.8 mg) –PTSD therapeutic dose is 5.6 mg
- Low dose TNX-102 SL (2.8 mg) showed an improvement in sleep quality in Phase 2 and Phase 3 FM trials

Agitation in Alzheimer's Disease

- Phase 2 IND submitted March 2018
- Phase 2 study can be a pivotal efficacy study

Consequences of Agitation in Alzheimer's Disease

Outcomes

- Agitation challenges caregivers and is one of the most common reasons for patients having to transition from lower- to higher levels of care (nursing homes and other long-term care settings)[1]

Cost

- Agitation nearly doubles the cost of caring for patients with Alzheimer's disease
- It accounts for roughly 12% of the U.S. healthcare and societal cost of Alzheimer's disease, currently estimated to be $256 billion a year (2017)[1]

[1]The Alzheimer's Association, 2017 Alzheimer's Disease Facts and Figures: https://www.alz.org/facts/

Agitation in Alzheimer's Disease – Potential New Indication for TNX-102 SL

Successful pre-IND meeting in November 2017

- Phase 2 IND submitted March 2018

Significant unmet need

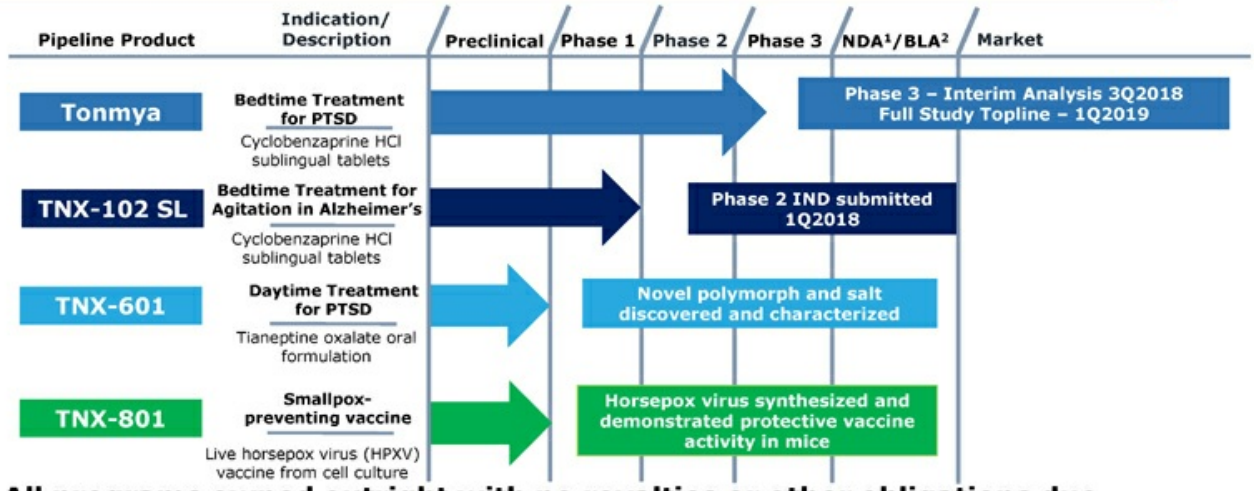
- No FDA approved drugs for the treatment of agitation in Alzheimer's

Mechanism of improving sleep quality

- Sleep disturbance is a significant and common symptoms in Alzheimer's

Pharmacological advantages outweigh potential concerns of using TNX-102 SL in treating agitation in Alzheimer's disease

Candidates in Development



All programs owned outright with no royalties or other obligations due

[1]NDA- New Drug Application; [2]BLA –Biologic Licensing Application; [3]Investigational New Drug Application

TNX-601[1]: A Potential Clinical Candidate for PTSD

Pre-IND Candidate

Targeting a Condition with Significant Unmet Need

Targeted as a 1st line monotherapy for PTSD: oral formulation for daytime dosing

- ✓ **Leverages expertise in PTSD (clinical and regulatory experience, market analysis, etc.)**
- ✓ **Mechanism of Action (MOA) is different from Tonmya**

- Tianeptine sodium (amorphous) has been approved in EU, Russia, Asia and Latin America for depression since 1987 with established post-marketing experience
- Identified new oxalate salt polymorph with improved pharmaceutical properties ideal for reformulation

Filed patent application on novel salt polymorph

- Issued patent on steroid-induced cognitive impairment and memory loss issues

Clinical evidence for PTSD

- Several studies have shown tianeptine to be active in the treatment of PTSD[2-5]

[1] Tianeptine oxalate Frančišković T, et al. Psychiatr Danub. 2011 Sep;23(3):257-63. PMID: 21963693
[2] Frančišković T, et al. Psychiatr Danub. 2011 Sep;23(3):257-63. PMID: 21963693

[4] Aleksandrovskiĭ IA, et al. Zh Nevrol Psikhiatr Im S S Korsakova. 2005;105(11):24-9. PMID: 16329631 [Russian]
[5] Onder E, et al. Eur Psychiatry. 2006 (3):174-9. PMID: 15964747

TNX-801 (Synthesized Live Horsepox Virus): A Smallpox-Preventing Vaccine Candidate

Pre-IND Stage

Potential improvement over current biodefense tools against smallpox

- ✓ Leverages Tonix's government affairs effort
- ✓ Collaboration with Professor David Evans and Dr. Ryan Noyce at University of Alberta
- ✓ Demonstrated protective vaccine activity in mice
- ✓ Patent application on novel vaccine submitted

Regulatory strategy

- We intend to meet with FDA to discuss the most efficient and appropriate investigational plan to support the licensure, either:
  - ✓ Application of the "Animal Rule", or
  - ✓ Conducting an active comparator study using ACAM2000
- Good Manufacturing Practice (GMP) viral production process in development

Targeting a Potential Public Health Issue

Material threat medical countermeasure under 21st Century Cures Act

- Qualifies for **Priority Review Voucher* (PRV)** upon licensure
  - ✓ **PRVs have no expiration date, are transferrable and have sold for ~$125 M**

[1]PRV can be applied to any BLA/NDA for priority 6-month review

Current Needs to Vaccinate Against Smallpox

Ongoing vaccination of U.S. troops

- Troops in the Global Response Force

Threat of smallpox re-introduction

- Strategic National Stockpile & public health policy

Re-emergence of monkey pox[1]

- Believed to resurgent because of vaccinia-naïve populations in Africa
- Multiple U.S. military operations ongoing in Africa
